ABSTRACT

Specialized Common Carriers, communications carriers which came into existence offering private line microwave service, are now significant competitors in the long distance telecommunications industry. This thesis provides military installation telecommunications managers with a basic knowledge of how Specialized Common Carriers entered the telecommunications market, what services Specialized Common Carriers offer, and how to obtain these services for a military installation. It includes a case study evaluation of the potential use of long distance services of two of these competing common carriers at Naval Air Station Moffett Field, California. A computer program used to calculate the costs of using these two alternative long distance carriers is included as part of the case study.

ACKNOWLEDGMENTS

The author would like to express sincere thanks to Sam Telleson of AT&T Communications, Peter Hainsworth and Ken Sorenson of MCI Telecommunications Corporation, Renee Dunn of GTE Sprint Communications Corporation, Bill Weller of Western Division, Naval Facilities Engineering Command, Lois Gustie and Star Pelton of NAS Moffett Field's Public Works Department, and many, many others who were willing to provide information and discuss the topic of this thesis.

A special thanks goes to the author's wife, Teresa, and children, Susan, Randall, and Jonathan, for their patience, perseverance, love, and understanding through the long months of this effort.

I. INTRODUCTION

This thesis addresses Specialized Common Carriers (SCCs), those communications carriers which entered the market offering special communications services not adequately being provided by existing common carriers.[1] Initially, the special services offered by SCCs were primarily point-to-point private line microwave links for data or other customm transmission needs, but today SCCs are competing in markets that have historically been open only to the large domestic carriers such as American Telephone and Telegraph (AT&T) and Western Union. Today SCCs are succeeding, not in the private line market in which they started, but in the long distance, switched network services market in direct competition with AT&T. In fact, the offerings of SCCs today are so "un"-special that some authors refer to these carriers as **Other** Common Carriers (as in **other** than AT&T). This thesis will refer to these carriers as Specialized Common Carriers, the name attached to them when they first entered the market.

Before the advent of SCCs the base telecommunications manager[2] would rely heavily on the local telephone company representative to fill any long distance telephone needs since: 1) no other companies were in a position to offer service; and 2) the telephone company representative was glad to do it. Today, amidst fierce competition in the long

---

[1]Some other classes of common carriers are Community Antenna Television (CATV), packet switching networks or Value Added Networks (VANs), mobile radio-telephone, marine radio-telephone, radio paging, domestic, and international carriers.

[2]The term "base telecommunications manager" is used throughout this thesis to refer to telecommunications managers at all types of military installations whether bases, posts, stations, or whatever.

distance market, the base telecommunications manager must recognize that this attitude is no longer economically sound. The purpose of this thesis is to assist base telecommunications managers in understanding how SCCs came into existence, what long distance switched voice network services SCCs offer, how to evaluate the potential use of SCC services at their installations, and how to begin the process to procure these services.

This thesis is organized as follows: Chapter II discusses the major events leading up to and following the Federal Communications Commission (FCC) ruling which authorized SCCs to openly compete in the private line microwave field.[3] Chapter III gives information on the services offered by SCCs and compares these services to those offered by AT&T. This chapter also discusses competitive procurement of SCC services and the current use of SCC services at various military installations and Department of Defense activities. Chapter IV is a case study analysis of a specific military installation (Naval Air Station Moffett Field, California) for the potential use of SCC long distance telephone services instead of or in addition to AT&T services. A computer program which calculates the costs of using services of two of these alternative long distance carriers is included as part of the case study. Chapter V summarizes the thesis.

---

[3]Appendix A contains a chronology of major events affecting Specialized Common Carriers.

II. SPECIALIZED COMMON CARRIERS--A HISTORY

A. THE LONG DISTANCE MONOPOLY

Since Alexander Graham Bell's patent was issued in 1876, the Bell Telephone Company and the American Telephone and Telegraph Company (AT&T) have had a nearly continuous monopoly on providing local and long distance telephone service in the United States.[4] Setting aside the arguments whether the telephone industry was a natural monopoly[5] in the beginning, except during a few years between 1894 and 1907, and from 1968 until today, an approved monopoly it was.

The first period of exception to the monopoly was caused by the expiration of the Bell patent in 1894. As a result of the ensuing competition, the independent telephone companies owned 44 percent of all telephones by 1902 and 51 percent by 1907 [Ref. 4]. The period ended with the recall of Theodore Vail as the president of AT&T as he changed the company's policy from one of meeting competition to one of buying (or forcing) competitors out of the market.

In 1910 the Interstate Commerce Commission was given regulatory authority over the telephone industry, but it was not until the passage of the Communications Act of 1934 and the formation of the Federal Communications Commission (FCC)

---

[4]The Bell Telephone Company was formed from the Bell Patent Association in 1877 and the American Telephone and Telegraph Company was formed in 1885 by the Bell Telephone Company to operate its long distance system. For an in depth review of the telephone industry's history see references 1, 2, and 3.

[5]A natural monopoly is an economic concept based on the principle that in certain industries one company can provide services more economically and efficiently than several companies in a competitive environment. Reference 5 is an excellent reference on this subject.

that the telephone industry was subject to any real regulation.[6]

The period of FCC regulation is very significant in the history of Specialized Common Carriers and is discussed in the following sections of this chapter.

B. THE ABOVE 890 AND CARTERFONE DECISIONS

Three FCC actions considered as landmarks in preparing the way for new entrants into the common carrier private line microwave field are the 1959 and 1960 FCC rulings commonly referred to as the **Above 890** decisions and the 1968 FCC ruling dubbed the **Carterfone** decision.

1. Above 890 Decisions

Microwave radio, an outgrowth of the invention of the klystron tube by Bell Laboratories and the M.I.T. Instrumentation Lab, was developed during World War II for radar applications. It was modified and began being used as a transmission medium for point-to-point communications because of its increased capacity, better quality, and higher reliability over wire or cable transmission systems. Shortly after World War II, Western Union built a microwave system connecting New York City and Philadelphia as an experiment to see if it was suitable for use as a common carrier system **[Ref. 6]**. By 1956 microwave transmission accounted for 22 percent of the 10.5 million circuit miles of the telephone system **[Ref. 7]**.

The 1959 and 1960 FCC **Above 890** decisions opened the microwave field to private firms and individuals allowing them to install microwave systems utilizing the frequency

---

[6]Even with the FCC regulating the telephone industry there is some question as to who regulated whom between the FCC and AT&T. In the FCC's first twenty-five years of existence there was no regulation which significantly decreased AT&T's monopolistic position.

spectrum above 890 MHz for their own use. While this decision did not authorize new companies to compete with established common carriers, it was certainly a step in that direction. Since the FCC prohibited sharing facilities and systems, only companies or users needing a large volume of circuits between two points were economically able to take advantage of building their own systems instead of leasing from the common carriers.

The **Above 890** decisions were not the result of petitions of companies seeking entrance into the microwave carrier market, as one would expect, but instead were the result of the persistence of microwave equipment manufacturers and potential users of private microwave links [Ref. 8].

The proceedings which led to the **Above 890** decisions began in 1956 with an FCC review of microwave frequency allocations which included a look at letting private users construct their own microwave systems when common carrier facilities were already available. The idea of private microwave systems was not a new one[7] for there were already tens of thousands of route miles of microwave systems in existence to serve railroads, mining operations, pipelines, and other right-of-way companies at the time of the Above 890 proceedings. [Ref. 7] However, the prevailing FCC policy was to grant microwave licenses only to common carriers and right-of-way companies due to a perceived shortage of frequencies available to allocate.

The opposition by established common carriers (specifically AT&T, Western Union, and the independent telephone companies) was fierce. Their arguments against permitting private concerns to build their own microwave

---

[7]The first application for a private microwave system was submitted in 1948 by a railroad company as an experiment to compare the service and cost of their own system with the circuits they were leasing from common carriers [Ref. 6].

systems were based on claims that the frequency spectrum was limited and that the FCC had a responsibility to protect the economic interests of the established common carriers by prohibiting competition. They also argued that licenses for private microwave facilities should be given only when common carrier services were unavailable and should be revoked when common carrier facilities became available. [Ref. 7] Furthermore:

> The Bell System witnesses contended that to permit the licensing of private systems where common carrier facilities are available would cause irreparable harm to the telephone company's ability to provide a basic nationwide communications service, which is vital in times of peace but indispensable in times of national emergency. Also, they claimed that widespread licensing of private systems would not only increase the cost of communications to the Nation's economy as a whole but would cast an added burden upon the individual and the small businessman who would continue to rely on common carriers. [Ref. 9]

The arguments of AT&T and the others failed, because, "...the fact remained, the private applicants pointed out, that if permitted to construct their own facilities, they would provide for their needs at much lower costs than the carrier tariffs" [Ref. 10]. The FCC made their decision in July 1959 concluding: "...there are now available adequate frequencies above 890 Mc[8] to take care of the present and reasonably forseeable future needs of both the common carriers and private users for point-to-point communications systems" [Ref. 11].

Not ready to give in without a fight, the common carriers asked the FCC to take another look at the frequency spectrum question stating that with communications satellites coming into existence the FCC should wait until it was certain the satellite systems would not need the frequencies

---

[8]The units of frequency measurement were changed from cycles to Hertz after these decisions.

above 890 MHz. The FCC reaffirmed their original decision in 1960.

2. Carterfone Decision

From its beginning, AT&T had a policy of refusing interconnection with anyone and everyone. This was their way of ensuring their monopoly status. However, this stand was changed when antitrust litigation in 1913 forced AT&T to promise to allow independent telephone companies to interconnect with the AT&T long distance network.[9] Connection of equipment or attachments by customers was quite another matter--they were strictly prohibited by AT&T. In fact, AT&T maintained they had the right to remove the equipment or stop service to the customer. [Ref. 12 , 13]

In 1921 the Hush-A-Phone Corporation began manufacturing a simple non-electronic device to place over the telephone mouthpiece to prevent room noises from being picked up, as well as to provide some privacy for the telephone user so his/her conversation would not be heard by others in the room. AT&T sought prohibition of use of the device. In 1955 the FCC weakened the AT&T interconnection position by ruling:

> The provisions ...shall not be construed or applied to bar a customer from using devices which serve his convenience in his use of the facilities of the Telephone Company ...provided any such device so used would not endanger the safety of Telephone Company employees or the public; damage, require change in or alteration of, or involve direct electrical connection to the equipment or other facilities of the Telephone Company; or interfere with the proper functioning of such equipment or facilities; or impair the operation of the telephone system or otherwise injure the public in its use of the Telephone Company's services. [Ref. 14]

---

[9]This promise is known as the "Kingsbury Commitment," named after N.C. Kingsbury, then Vice-President of AT&T.

In spite of this decision, AT&T still generally refused interconnection.

AT&T next took on the Carter Electronics Corporation when they began marketing the Carterfone, a device which acoustically coupled a mobile radio system with the telephone system through the telephone handset.[10] AT&T insisted that they "must control every element of the [telephone] system" to insure that it works best for all. In the 1968 **Carterfone** decision the FCC concluded:

> ...a customer desiring to use an interconnecting device to improve the utility to him of both the telephone system and a private radio system should be able to do so, as long as the interconnection does not adversely affect the telephone company's operations or the telephone system's utility for others [Ref. 14].

The **Carterfone** decision, that the Bell System had to permit interconnection of non-Bell equipment as long as the interconnection would not harm the system or disrupt the ability of others to use the system, was important since it would allow for the future interconnection of Specialized Common Carrier (SCC) switching equipment.

C. MCI DECISON

The development of computers and their widespread acceptance and use in the 1960s created a need for data communications that was essentially unavailable from the established common carriers. The AT&T and Western Union systems were designed using analog technology primarily intended for voice transmission not data. In 1963, Microwave Communications, Incorporated (MCI) applied for FCC certification for public common carrier point-to-point microwave communications service between Chicago and St Louis and intermediate

---

[10]This was an accustical modem arrangement, but instead of transmitting data it coupled voice signals.

points. MCI's proposal was to provide simply a microwave link between the two locations. The subscribers would be required to provide their own terminal equipment and connections with the MCI system.

AT&T, General Telephone, Illinois Bell, Southwestern Bell, and Western Union opposed the application (as would be expected) contending that:

> ...the service would meet no demonstrated need, that it would result in wasteful duplication of facilities, that MCI did not posess the legal, technical, and financial qualifications to install and operate the system, and that the system would cause radio interference to existing and future facilities of the established common carriers [Ref. 15].

Besides these arguments, they contended that it was a waste of the FCC's time to consider the application since MCI would not be able to provide local service (since this industry was already monopolized) and existing carriers would refuse to provide interconnection [Ref. 15].

Probably more as an experiment than any other reason, the FCC approved the MCI application in 1969 in what is called the **MCI** decision. Kahn explains the basis for the approval thusly:

> MCI offered two things that the Bell companies and Western [Union] did not: first, low rates - its proposed charges were less than half those of the established carriers - and second, far greater freedom and flexibility in use of the service: customers could attach such equipment as they saw fit and up to five of them could share the use of a single channel, thus further reducing the cost of each. And it was this proposed contribution that, in the last analysis, induced the FCC to approve the application. [Ref. 16]

D. SPECIALIZED COMMON CARRIER DECISION

Following the MCI decision new entrants were jumping on the private line microwave system bandwagon in spite of the FCC statement that their decision would not be considered as a binding precedent for future applications. By 1971 there were applications on file with the FCC for 1,977 microwave stations in 46 separate proposals from 33 new carriers. [Ref. 17] The FCC was not particularly interested in reviewing each of these applications individually and therefore set out to establish a ruling applicable to all of them. The resulting June 1971 ruling, the Specialized Common Carrier decision, opened the SCC field to open competition. The FCC said:

> We find that: there is a public need and demand for the proposed facilities and services and for new and diverse sources of supply, competition in the specialized communications field is reasonably feasible, there are grounds for a reasonable expectation that new entry will have some beneficial effects, and there is no reason to anticipate that new entry would have any adverse impact on service to the public by existing carriers such as to outweigh the considerations supporting new entry. We further find and conclude that a general policy in favor of the entry of new carriers in the specialized communications field would serve the public interest, convenience, and necessity. [Ref. 18]

E. AFTER THE SPECIALIZED COMMON CARRIER DECISION

As with the preceding decisions, the Specialized Common Carrier decision met with strong opposition from the existing common carriers. In addition to asking the FCC to reconsider its decision based on the arguments previously used while fighting the MCI decision, the existing common carriers refused to interconnect the SCCs through the local telephone exchanges knowing that, if it were difficult for potential users to access the SCC systems, the SCC market

would be restricted. The FCC had upheld that AT&T and the others must provide interconnection from the beginning, but the regulatory and legal processes precluded full interconnection rights to the SCCs for five years after the **Specialized Common Carrier** decision. [Ref. 19]

During this period MCI continued to create difficulties for the established common carriers by introducing its Execunet service. Touted as a "shared" private line service, Execunet very closely resembled the long distance voice service offered by AT&T with the exception that Execunet had only a very small number of cities in its network. Instead of leasing a private line full-time for a monthly rate, Execunet subscribers could dial into the system when required and be charged on a time and mileage basis, with connect and monthly minimum charges. Thus users that could not afford a full-time private line could afford this "shared" private line.

AT&T quickly asked the FCC to bar MCI from offering Execunet since it was obviously (obvious to AT&T with their long distance switched network monopoly) not authorized by the **Specialized Common Carrier** decision. The FCC did order MCI to discontinue Execunet, but their action was later reversed by an appeals court.

1. Switched Voice Networks: The SCC's Money Maker

While SCCs continue to offer private line point-to-point service, which is what the FCC **Specialized Common Carrier** decision originally permitted them to provide, their "bread and butter" business is now their switched voice network offerings. Revenues in 1983 from the long distance services provided by MCI, GTE Sprint, and ITT United States Transmission Systems (USTS) totaled $2.44 billion. (See Table I.) While only seven percent of AT&T's $35 billion,

TABLE I

1983 Long Distance Service Revenues

	Revenues (millions)	Profits (millions)	Subscribers (thousands)
AT&T	$35,000	$1,430	85,000
MCI	$ 1,520	$ 203	1,550
GTE Sprint	$ 750	$ 66	920
ITT	$ 170	$ 8	95

this market is exhibiting exceedingly rapid growth.[11] [Ref. 20] Analysts predict that this may increase to 10 to 20 percent of a more than $100 billion per year industry by 1990 [Ref. 21].

When the SCCs started up, the number of cities to which they offered services was very small and all (or nearly all) were large metropolitan areas. Today MCI, GTE Sprint, ITT, and other SCCs have networks that extend from coast to coast. MCI's system, begun as a single microwave system between St Louis and Chicago, has evolved into a nationwide network connecting thousands of cities in hundreds of metropolitan areas. (See Appendix C for a listing of all the area codes and prefixes currently on the MCI network.)

In spite of the success that the SCCs have had in getting favorable regulations and establishing a position in the common carrier market, they are still faced with problems. They may have nearly overcome the regulatory problems

---

[11]In 1980 MCI, Southern Pacific Communications (now GTE Sprint), ITT USTS, and Western Union had $400 million in revenues (only two percent of AT&T's $20 billion in the same year). In 1975, these companies had only $30 million in revenues. [Ref. 21]

(particularly since AT&T has lcst control of its operating companies[12] and is primarily in the competitive lcng distance or long-lines business) but there are technical problems that must be resolved.

The first technical problem is that dual tcne multi-frequency (DTMF) signalling[13] is required tc access the SCC's network. If a pctential customer is among the majority that own rotary or pulse dial telephone instruments the potential customer is currently not able to use the SCCs' lcng distance networks. This is a serious disadvantage to the SCCs since they are trying to reach as much cf the lcng distance telephone market as possible. Next, to make calls cn the SCC's netwcrk requires dialing[14] twelve or more extra digits (besides the ten digit number of the party to be called): a seven digit telephone number to access the SCC switch (the local access number), then a five or more digit accounting code. Third, the SCC's systems have been known tc recognize ncise on the line as a completed call[15] so that a customer cculd be billed for calls that actually never went through [Ref. 26].

The first twc problems can be eliminated thrcugh the use cf dedicated access lines (DALs)[16] or least cost routing

---

[12]References 22, 23, 24, and 2 are good references which discuss the AT&T divestiture. Reference 25 deals with the impact cf the AT&T divestiture on telecommunicatcns services to the Department cf Defense, but, in this author's cpinicr, it is neither objective nor current.

[13]Touch tone is the Bell registered trademark for this type cf signalling.

[14]Even with DTMF signalling the process of inputting a telephone number is called "dialing" although no dialing is actually dcne.

[15]This is due to the fact that the SCCs are not able to directly ccnnect to the local telephone exchange to receive call ccmpletion signals and must rely on their ccmputers recognizing a change in the ringing pattern.

[16]A dedicated access line (DAL) is basically a tie line to the SCC switch which eliminates the need to dial the local access number cr an authorization code to make a call cn the SCC network.

devices (available for a monthly fee from MCI and GTE Sprint), but these solutions are not for the small user since the money saved by using the SCCs services would not compensate for the cost of the DAL or least cost routing device. The SCCs will be remedying these problems for even the small user beginning in the fall of 1984 as a result of AT&T's divestiture of its operating companies. After the divestiture, MCI and the others will be able to connect directly to the local telephone exchange for access[17] as well as for recording billing information. A glimpse of the coming changes was seen in 1981 when the Northwest Iowa Telephone Company, one of the nearly 1,500 independent telephone companies in the United States, offered MCI service to all of its customers. Now their customers can dial "6" (using rotary or pulse dial, or touch tone telephones) to make long distance calls via MCI's circuits, just as dialing "1" accesses the AT&T long distance system. [Ref. 27 , 28] Other digits for access or billing codes are unnecessary since these functions are done electronically by the telephone company's central office equipment.

Another major disadvantage of using SCC services was that the user could complete calls only to other cities within the SCCs network (assuming the user was in a city served by an SCC; this is still the major problem of using SCCs services). An FCC ruling in 1980 permitting the resale of Wide Area Telecommunications Service (WATS) changed all that.[18] Now SCCs offer the capability to place calls to

---

[17]"Equal access" is the term being given to this issue--where all carriers are to receive "equal access" to the long distance market. Starting in September 1984 local companies must begin offering their telephone users the opportunity to choose the long distance carrier they want to give their business. One third of a local companies' access lines must enter the realm of "equal access" by September 1985 and the remainder by September 1986.

[18]Although not the subject of this paper, this ruling also led to the creation of "resellers"--those who lease circuits from common carriers and resell these circuits (or

anywhere in the continental United States but only from selected network cities. The rates are usually higher for calls to these non-network cities, but are still cheaper in most cases than the same call placed with AT&T.

2. Changes Taking Place

SCCs are still pressing forward regardless of problems. In 1980 an FCC study proclaimed that telephone competition is "speeding innovation and meeting unsatisfied communications needs" [Ref. 29]. Now that SCCs are confident they are not going to be regulated or dominated out of existence, they are making significant plans and changes to their offerings. Besides continuing to expand their networks, SCCs are installing fiber optic cables and using communications satellites for their networks. They are even investigating using cable television networks to provide local telephone service.[19] [Ref. 30]

What will the future bring? The FCC ruling in 1980 permitting the resale of WATS suggests the possibility of the formation of what Johnson describes as:

> ...'carrier's carriers,' whose express objective would be to build transmission facilities for use by other common carriers. ...While AT&T is itself a common carrier, one could imagine in the future a firm whose entire business consists of leasing facilities to other common carriers. [Ref. 31]

Perhaps this is in the future for one of the SCCs.

---

use of the circuits in the case of switched type services) to customers.

[19]No doubt the SCCs will be going after the still monopolized local telephone service market if their test results are promising.

F. CONCLUSION

This chapter has presented a brief history of the SCCs from the invention of microwave radio to the use of fiber optic cables and communications satellites. Fortunately, the early FCC decisions on matters such as using microwave frequencies for private microwave systems (different from **private line**) and interconnection were favorable for SCCs. Even with the favorable regulations, it was a very risky undertaking for **very** small companies such as MCI to take on the corporate giants such as AT&T and its cohorts in the common carrier industry, for AT&T and the others were ready and able to fight for their previously well-protected monopoly.[20] But the SCCs survived the AT&T self-preservation tactics and have established themselves as small but rapidly growing competitors.

---

[20]The chairman of the board of MCI later said it had cost MCI $10 million in legal and other regulatory costs in their effort to get their network approved--a high price to pay considering the total cost of their St Louis to Chicago microwave link was $2 million [Ref. 32]. Data Transmission Co. (DATRAN) paid an even higher price--they lost their struggle to compete and filed for bankruptcy only a couple of years after they began.

III. SPECIALIZED COMMON CARRIER SWITCHED VOICE NETWORK SERVICES

This chapter discusses the switched voice network offerings of AT&T, MCI, and GTE Sprint, and the use and procurement of SCC services within the Department of Defense.

A. AT&T'S SERVICES--THE MARKET STANDARD

The long distance telephone service that everyone is intimately familiar with is AT&T's Long Distance Message Telecommunications Service (LDMTS), or MTS for short. MTS is the composite service of direct distance dialing and operator assisted calling (person-to-person, collect, third number, etc.). With MTS a telephone user (who is willing to pay for it, of course) can place a call to anywhere in the world. AT&T's MTS is billed according to the duration of the call, the rate period (day of week and time of day)[21] in which the call was made, and the distance to the called number.[22]

Wide Area Telecommunications Service (WATS) is another AT&T service that most have come in contact with.[23] Some contend that WATS differs from MTS only by the method of billing. While it is true that WATS calls are routed over the same AT&T circuits as MTS calls, one major difference

---

[21]In 1982 AT&T changed their method of considering the rate period in calculating the cost of a call. Previously, the entire call was billed according to the rate period of the first minute. Now calls are billed at the rate of the rate period in which each minute of the call occurs.

[22]This is referred to as usage sensitive pricing. It is also referred to as time and/or distance (or mileage) sensitive pricing.

[23]This discussion is about outward WATS. Inward WATS (800 service) is basically the same as outward WATS except the calling is inward.

exists. WATS calls may be originated only via a limited number of WATS trunks connected to the PBX.[24]

Interstate WATS is offered in the form of six geographical areas called Service Areas (formerly Bands). Service Area 1 includes the states adjacent to the state in which the call is originated and each higher numbered Service Area adds a larger geographical area to the lower numbered Service Area(s). Service Area 5 WATS permits calling to anywhere within the continental United States (outside of the state in which the call was originated). Service Area 6 adds Alaska and Hawaii.

In June 1981 there was a significant restructuring of how WATS is billed. Before that time WATS was available in either full business day WATS lines (up to 240 hours of usage per month per line at a flat rate with hours over 240 billed at an additional hourly rate)[25] or measured time WATS lines (up to ten hours of usage per month per line at a flat rate with hours over ten billed at an additional hourly rate). Today, WATS has no minimum usage requirement (but there is a monthly recurring charge per line) and every call contributes to the monthly bill. WATS costs are calculated from the average use per WATS line per rate period (and the distance as determined by the Service Area capability of the WATS line). Calls are measured in one second increments and the total number of minutes must be greater than or equal to the total number of calls in each rate period during the billing period (minimum average time requirement--MATR).

---

[24]The number of WTS calls that can be made simultaneously is also also limited by the number of dial 9 trunks, but these are usually more numerous than WATS lines.

[25]For 240 hours of usage in an average 22 business day month the circuit must be in use almost 11 hours per business day. **That's definitely a full business day!** This is the source of the "WATS is free" syndrome. Companies were underutilizing their WATS lines and permitted, if not encouraged, personal calls via the company's WATS lines. (This sounds a lot like the rationale for non-official use of AUTOVON.)

B. SCC SWITCHED VOICE NETWORK SERVICES

SCCs offer basically two types of services which look remarkably like AT&T's services: dial access service and dedicated (or direct) access service.[26] The dial and direct access services offered by MCI and GTE Sprint are described below.[27]

1. Dial Access Services

Dial access service most closely resembles AT&T's MTS (without operator assistance--as actor Cliff Robertson has pointed out in the recent AT&T television commercials). A customer dials a local access (telephone) number and a billing code to access the SCC network and, finally, the desired number to be called. Like AT&T's MTS, the customer is billed for SCC dial access service according to the duration of the call, the rate period, and the distance to the called number. The rate periods used by AT&T, MCI, and GTE Sprint are listed in Table II.[28] Non-recurring and monthly recurring charges for AT&T MTS, and MCI and GTE Sprint dial access services are shown in Table III. (AT&T's current and proposed MTS tariff rates, and the current tariff rates for MCI Execunet and GTE Sprint's SPRINT are found in

---

[26]A third service is also offered by some of the SCCs which provides inward calling capability. This service will not be discussed in this thesis as most base telecommunications managers will not have a requirement for such service. Installations or activities (such as recruiting units) currently using In-WATS (800 service) may want to obtain information on SCC inward calling service offerings.

[27]The services of MCI and GTE Sprint were investigated since 1) they are the two biggest SCCs and 2) efforts to obtain information from ITT and Western Union were discouragingly unfruitful. A base telecommunications manager investigating SCC services should be cautioned not to call the toll free number for the SCCs and expect to have his/her questions answered. The best bet is to contact the nearest sales office for the SCC and know what information is needed.

[28]The rate periods, rates, and recurring and non-recurring charges which appear in this chapter are from references 33, 34, 35, 36, 37, 38, and 39.

Appendix E.) Unlike AT&T's MTS, SCC dial access service currently requires dialing many digits to access the network.[29]

TABLE II

Evening			
5:00 pm	to but not including	11:00 pm	Sunday-Friday
Night and Weekend			
11:00 pm	to but not including	8:00 am	All days
8:00 am	to but not including	11:00 pm	Saturday
8:00 am	to but not including	5:00 pm	Sunday

a. MCI Execunet Service

MCI offers dial access service in two flavors: Network-only Termination[30] and "Universal Termination."[31]

---

[29]As mentioned in Chapter II, customers of the Northwest Iowa Telephone Company can dial a single digit to access MCI's Execunet service. As SCCs are given "equal access" to the long distance market, more customers will be provided single digit access to the SCCs (assuming they are in an area in which an SCC offers service). Another way to beat the extra digits is by using an autodialer or a least cost routing device (particularly for a big user).

[30]AT&T only offers Network-only Termination service, but all cities are on the AT&T network.

[31]The term "Universal Termination" is misleading. While "Universal Termination" service offers coverage which is greater than that provided by Network-only Termination, it, too, has its limitations. MCI's "Universal Termination" service allows a user to complete calls to anywhere in the continental United States, Hawaii, and Puerto Rico and to

TABLE III

SPRINT

Monthly Recurring

$ 5 minimum usage

Network, or Execunet Service, calling can be originated from the cities in Table IV and can be completed to any network city.[32] Calls to non-network cities (or "Universal Termination" calling) can be originated only from cities listed in Table V. MCI calls this Execunet Service with Nationwide Calling. Calls made via Execunet Service with Nationwide Calling may be completed to anywhere in the continental United States, Hawaii, and Puerto Rico and to some locations in Canada. Calls to Alaska cannot be made

---

some locations in Canada. MCI does not offer calling to Alaska. "Universal Termination" with GTE Sprint permits calling to anywhere in the continental United States, Hawaii, Alaska, Puerto Rico, and the U.S. Virgin Islands. (See the subsection in this chapter on "Intrastate Service" for a discussion on intrastate calling.) AT&T's MTS service can be regarded as the only truly "Universal Termination" service since a user can call anywhere in the world (...perhaps with some difficulty).

[32]A complete listing of the area codes and prefixes on the MCI network is found in Appendix C.

via MCI. Calls completed to cities on the MCI network are billed at a lower rate than calls completed to non-network cities. MCI refers to this as a two-tiered system--Tier 1 to network cities and Tier 2 to non-network cities. The duration of an Execunet call (with or without Nationwide Calling) is rounded to the next higher full minute for calculating the cost of the call.

b. SPRINT Service

GTE Sprint's latest tariff revision (Jan 1984) combined two services, Residential Sprint and Business Sprint, into one service now called SPRINT.[33] Now all calls, network and non-network, are billed at the same rate. Previously, Residential and Business Sprint services had separate, two-tiered rate structures as Execunet. SPRINT calls may be originated in any of the cities in Table VI and

may be completed tc anywhere in the continental United States, Hawaii, Alaska, Puerto Rico, and the U.S. Virgin

Islands. (Calls originated in Hawaii cannot be completed to Puerto Rico or the U.S. Virgin Islands.) The duration of SPRINT calls are also rounded to the next higher full minute for calculating charges. The rate for SPRINT service is varied according to the total amount of the bill so that higher usage has a higher discount. (See Appendix E.)

c. Additional Features with MCI and GTE Sprint Dial Access Services

MCI and GTE Sprint offer several additional features with their dial access services. These are least cost routing, group billing, speed dialing, travel/credit card service, and magnetic tape billing. Least cost routing enables the use of rotary or pulse dial telephones to complete calls via the SCC dial access services. (It's a must at most military installations.) Probably the feature of most interest to a military installation, besides least cost routing, would be the group billing. This feature permits bills itemized according to billing (authorization) code. MCI's Corporate Account Service offers 50 accounts[34] at no monthly service charge if the combined monthly bill is at least $2,500. There is no charge for each additional code for every $50 added to the total monthly bill. GTE Sprint's group billing service is called Corporate Billing Arrangement. It offers 50 codes at no monthly charge with a minimum of $1,500 usage per month and each additional code (up to 200) is free for every $20 of usage added to the monthly bill. With a bill of $15,000 per month 2500 codes can be provided at no cost. Both MCI and GTE offer additional accounting codes (up to 99 accounting codes per authorization code) for a small monthly fee.

---

[34]The numbers of accounts which are given here are provided as examples of the service offered. Other quantities, smaller and larger, are available per the SCC's established rates.

d. Advantages and Disadvantages of Dial Access Service

Dial access service offers the following advantages:

1. With additional billing numbers, bills are automatically sorted for verification.
2. Some dial access services are billed in less than one minute increments--a potential cost savings.
3. The number of possible simultaneous calls is only limited by the number of dial 9 trunks.

Some of the disadvantages of dial access service are:

1. If the SCC has a lot of customers in the area there may be access problems. These access problems may depend upon how often the SCC upgrades their equipment to provide the necessary levels of circuits/service.

2. Currently, unless the customer uses an autodialer or has speed dialing or a similar capability, there are a lot of numbers which must be dialed because of the local access number and the billing code. (This problem will disappear with "equal access.")
3. Since there are no operators, there are no person-to-person, collect, or third number calls (most base telecommunications managers would be glad not to have to worry about these, anyway).
4. Every call which results in getting the SCC dial tone will cost (if there is a charge for the local or long distance call to access the SCC network), not just the ones which result in a completed long distance call.
5. Basically, there is no overseas calling capability.

e. When to Consider Using Dial Access Service

When should a base telecommunications manager consider using dial access service?

- **When it costs less than the service currently being used!**
- If local calls are free and the local access number truly is local.
- If a lot of calls must be made at the same time. (Only limited by the number of dial 9 trunks.)
- If single digit access to the SCC is available, or, if not available, autodialing or speed dialing capability is available.
- If DTMF signalling is available (either at the switchboard or at each call station). (Not necessary if single digit access is available.)

2. Dedicated Access Services

Dedicated access service is the SCC's marketing answer to AT&T's WATS. The customer accesses the SCC network through a dedicated access line (DAL), eliminating the need to dial the local access number or billing code. Dedicated access services also use usage sensitive pricing. Table VII lists the non-recurring and monthly recurring charges for AT&T WATS, and MCI and GTE Sprint dedicated access services. (AT&T's current and proposed WATS tariff rates, and the current tariff rates for MCI WATS and GTE Sprint's Direct Sprint are found in Appendix E.)

a. MCI Network Service and MCI WATS

MCI offers dedicated access service in the same two flavors as their dial access service: Network-only Termination and "Universal Termination." MCI Network Service allows calling only to network cities, while calls made via MCI Network Service with Universal Termination can be completed to anywhere in the continental United States, Hawaii, and Puerto Rico and to some locations in Canada. MCI has attached the name MCI WATS to their MCI Network Service with Universal Termination. Although the name suggests it, MCI WATS cannot be viewed as equivalent service with AT&T WATS since calls cannot be completed to Alaska. Table VIII lists the cities from which both of these services may be originated. Durations of calls via these services are rounded to the next higher thirty second increment,[35] and, like AT&T WATS, MCI's dedicated access services have a one minute minimum average time requirement.

---

[35]There is a savings when billing is in less than one minute increments. Self states for an average call length of five minutes that one second, six second, 30 second, and initial minute then 30 second increment billing will save 10, 9, 5, and 3.8 percent, respectively, of the cost of a call billed in full minute increments (like AT&T MTS, MCI Execunet, and GTE Sprint's SPRINT) [Ref. 40].

Termination at Rate Center	$ 5 per line
Termination within LDA (Local Distribution Area)	$35 per line
Termination outside LDA but within state boundaries	$35 per line + $4 per mile outside LDA boundary
Termination outside LDA and crossing state boundaries	$35 per line + $4 per mile from customer premise to switch location
Circuit Termination	$65 per line
No Non-Recurring Charges	

b. Direct Sprint Service

GTE Sprint's Direct Sprint service is also available in Network-only Termination and "Universal Termination." Calls for both types of service may be originated from the cities in Table IX.[36] Direct Sprint calls are measured in six second increments (the duration of the call is rounded up to the next higher six second increment). The rate structure is complicated by the fact that, in addition to network and non-network rates which are mileage independent, there are mileage sensitive rates for calls to Alaska and to and from Hawaii (other than Honolulu). Direct Sprint also uses a one minute minimum average time requirement.

---

[36]Appendix D provides a complete listing of area codes and prefixes on GTE Sprint's network.

Los Angeles, CA	Wilmington, DE
Louisville, KY	

c. Additional Features with MCI and GTE Sprint Dedicated Access Service

Least cost routing, accounting codes, and magnetic tape billing are additional features offered with MCI Network Service, MCI WATS, and Direct Sprint Service. The least cost routing offering is a boon for those locations that do not have a sophisticated switch with least cost routing capability--which, unfortunately, includes nearly all military installations. Microprocessors leased from the carrier permit completing calls via the most economical method whether via AT&T MTS, WATS lines, SCC IALs, FX lines, or whatever. The accounting codes are also noteworthy. Rather than getting a bulk bill as with AT&T WATS, the accounting codes allow itemizing all calls by accounting code, making it easier to control the costs of

the calls. Accounting codes should be viewed as essential items for most military installations.

d. Advantages and Disadvantages of Dedicated Access Service

The following are some of the advantages of using dedicated access service:

1. No local access number or billing code to dial.
2. Usually less expensive than the carrier's dial access service.[37]
3. May permit removing local lines (dial 9 trunks) and thereby save money.
4. Call detail billing is available itemizing each call.

---

[37]Potential users must recognize that there is a break-even point since there are fixed costs (monthly recurring as well as order and installation costs) associated with dedicated access services. The combined sum of the fixed costs and the usage costs must be less than the costs of the service currently being used. Also, it is possible that the rates themselves may not be lower than the dial access service rates.

Some of the disadvantages of dedicated access service are:

1. Only one call at a time per DAL. If the circuit is busy, it's busy! DALs create the same problem as WATS--when the circuits are busy telephone users call via AT&T MTS anyway so it costs more.[38] This situation actually costs more twice because of lower overall usage of the WATS lines or DALs, which costs a higher rate for all calls, plus a higher cost for the MTS call. (Note that with least cost routing, telephone users do not realize they are using anything diferent.)
2. If the service is referred to as a WATS or WATS-type service, remember that many people have the misconception that WATS is free. WATS or WATS-type service is not free; in fact, it can be very expensive unless it is managed properly. Newton suggests replacing WATS lines with LATS (Limited Access Telephone Service) lines as a money saving measure:

> ....send a memo around the company to all employees saying, "We have cancelled our WATS lines because of the expense. We have now subscribed to a brand new telephone company service, called IATS--Limited Access Telephone Service. IATS lines are cheaper than WATS lines (which is why we got the LATS lines), but now all our LATS calls--each and every one--are billed and charged by the length of the call in minutes and seconds and by time of day."
>
> What have we done? We have killed the myth that WATS lines are free by cancelling our WATS lines. We have introduced the correct logic that calls cost money based on the time of day they were made and the length of the call. There is, of course, no such animal as a LATS line. [Ref. 41]

---

[38]Sometimes the amount of traffic which is being diverted to MTS (or other dial access service) is an indicator that there are insufficient WATS lines or DALs installed.

e. When to Consider Using Dedicated Access Service

When should a base telecommunications manager consider using direct access service?

- Again, when it costs less than the service currently being used. (Remember to consider fixed costs.)
- If WATS is already being used at the installation.
- If the number of long distance calls justifies several DAIS.
- If local lines (dial 9 trunks) can be removed when DALS are installed.
- When call detail billing is needed.

3. Intrastate Service

SCCs are interstate carriers. Prior to the AT&T divestiture they were able to provide intrastate service only in those states where they were authorized by the state's Public Utilities Commission (PUC). One of the changes mandated by the AT&T divestiture agreement was that the divested operating companies (or BOCs for Bell Operating Companies) would provide long distance service within the LATAs (Local Access and Transport Areas),[39] or intra-LATA calling, and calling between LATAs (inter-LATA) would be provided by AT&T and other carriers like the SCCs and resellers. Even so, all calls within a state are still subject to regulation by the state PUC. So far, SCCs have

---

[39]Local Access and Transport Areas, or LATAs, were created as a method of defining the boundaries within which the divested operating companies could provide "local" service. There are 161 LATAs. Idaho, Maine, New Mexico, and the District of Columbia each have one LATA for the entire state or district. All other states have more than one LATA.

been authorized to offer (at least partial) intrastate calling in six states [Ref. 20]. Simon and Whalen point out that:

> The PUCs also have the right, if they wish, to allow the "interexchange carriers" (also called "inter-LATA carriers") like AT&T, MCI, ITT, etc. to carry calls within LATAs in the states, though the BOCs are expected to object to this [Ref. 42].

Historically, calls which originate and terminate on the SCC network within a state have been completed. Calls within the State of California made via MCI's dial access and dedicated access services with "Universal Termination" are completed only if the called locations are on the network. Although they are not shouting it from the rooftops, GTE Sprint does not restrict intra-state (inter- or intra-LATA) calling via SPRINT or Direct Sprint with Universal Calling. They cannot offer or advertise service (in California) for solely intra-LATA calls, but no one checks.

The bottom line is: Potential users must check with the SCCs concerning their service offerings in a particular state.

C. USE AND PROCUREMENT OF SCC SERVICES IN THE DEPARTMENT OF DEFENSE

1. Use of SCC Services in the Department of Defense

In 1980, the author conducted an Air Staff (Headquarters USAF) directed study of the potential use of SCC services at all Strategic Air Command (SAC) installations in the continental United States. At that time the SCC marketing people seemed reluctant to provide information and assistance in spite of the potential to get part of the several hundred thousand dollars that are spent by SAC installations annually for long distance telephone service.

The major problems[40] with using SCC services at that time were:

a. SCC systems presently serve only major metropolitan areas. Calls can only be placed to and from cities within the SCC's network.

(1) Most SAC bases are not within the calling areas of the metropolitan cities served.

(2) Bases with SCC system accessibility will need to develop and maintain directories listing the cities and/or area and NNX codes served by the SCC because of the limited service.

b. Dual tone multi-frequency (DTMF or touch tone) signalling is needed to access the SCC systems. At most bases, this would require operator assistance to dial a seven digit access number, a multiple digit billing number, plus the ten digit telephone number to be called [Ref. 43].

But, as was mentioned in the previous chapter, most of these problems no longer exist since SCCs offer "Universal Termination,"[41] (from selected network cities) as well as DALs or least cost routing devices which enable calls to be completed without dialing the local access number or the billing code and from a rotary or pulse dial telephone instrument. Also, with the growth of the SCC networks more and more military installations are within their reach. Even with these problems corrected, SCC usage in the Department of Defense has been slow in getting started.[42] In fact, SCC use throughout the Department of

---

[40]Most of these problems were already mentioned in Chapter II.

[41]MCI plans to offer "universal origination" to its credit card customers in March 1984, providing access to the MCI network from any city in the United States through AT&T WATS or MCI circuits for an additional per minute charge.

[42]In 1982 MCI was providing service to only one Department of Defense activity, the Defense Telephone Service-Washington. It is highly likely that this was the only Department of Defense activity using any SCC services at that time.

Defense is currently limited to just a handful of places.[43] Worse yet (in the author's opinion), direction on their procurement and use is virtually non-existent. Why should the Department of Defense be concerned? Because there is money to be saved! According to MCI:

> ...While we have been unable to obtain an accurate figure for DoD's current cost for [administrative long distance telephone services,] estimates place these costs at a minimum of $500 million annually. The potential savings may be as high as $125 million annually.... [Ref. 44]

2. Procuring SCC Services

Sensing a hesitancy on the part of military telecommunications managers to move away from AT&T into the uncharted waters (as far as the Department of Defense was concerned) of the SCCs, MCI's Director of Government Marketing sent a letter to the Deputy Under Secretary of Defense (C3I) in August 1982 urging a stronger position for competitive procurement of long distance services. An attachment to this letter discussed the Federal Government's policy on competitive procurement of telecommunications services. An excerpt follows:

> The U. S. Government has specific, established policies which require agencies to compete their telecommunications requirements. The Defense Acquisition Regulations clearly state this duty in DAR 22-1005.1(b) which states that:
>
> > ...there are locations at which no single communications common carrier has the exclusive right to provide the required service. When this is the case and more than one common carrier is authorized and can provide the required service, the procurement shall be made from the source offering the lowest cost to the Government, if practicable.

---

[43]Per the author's conversations with offices in the Department of Defense and with SCC marketing personnel.

Similarly, DAR 1-300.1 requires all procurements to be performed competitively to the maximum practicable extent. In other words, an agency must compete its requirements for telecommunications service when it is able to do so. And since MCI's service now covers virtually the entire country, there is no excuse not to compete telecommunications service needs as the DAR requires.

Numerous DoD components have taken action to implement the fundamental policy position set forth in the DAR. The Defense Commercial Communication Office (DECCO) recently issued a "Policy for Seeking Competition for CONUS Private Line Services." The effective date is May 7, 1981. DECCO policy provides that increasing degrees of competition shall be used as the requirement expands....

.....

...DECCO clearly requires competition in private line services. The same policy considerations also apply to procurement of DDD or WATS equivalent message service, including MCI's Network Service.

The policy expressed in these documents is simply a reiteration of a competitive communications policy which DoD has stressed for many years. For example, by memorandum dated December 23, 1978, for the Secretaries of the Military Departments, the Chairman, Joint Chiefs of Staff, and numerous other DoD officials, Gerald Dineen stated that it is DoD policy that procurements for base telephone systems "will be completed to the maximum extent possible..." (Emphasis in the original.)

More recently, Deputy Secretary Frank Carlucci issued a memorandum for broad dissemination within DoD urging DoD managers to increase the use of competition in the procurement process. Mr. Carlucci's memorandum, dated July 27, 1981, stated categorically that:

> The value of competition in the acquisition process is one of the most widely accepted concepts. We believe that it reduces the costs of needed supplies and services, improves contractor performance, helps to combat rising costs, increases the industrial base, and ensures fairness of opportunity for award of government contracts. Despite our beliefs and efforts at furthering competition, there is a serious concern that our achievements are not adequate. Many in government and industry believe that we award too many contracts without adequate competition.
>
> I am therefore asking that managers in all levels review their efforts to obtain maximum competition in their contractual requirements. (Emphasis added.)

This last statement is particularly applicable to DoD base communications managers. For years, DoD base requirements have been sole sourced to AT&T. Mr.

> Carlucci's memorandum clearly requires reevaluation of this practice, and the injection of more competition intc lccal communications procurements.
>
> .....
>
> In summary, established federal policy mandates competition ir all procurements to the fullest extent practicable. This pclicy is well established in communications and all other areas of federal procurement. There is nc justification for a base communications manager to continue sole sourcing AT&T. Such a practice is clearly prohibited by the policies and regulaticns set forth above. [Ref. 44]

Subsequent tc receiving this letter, the Assistant Deputy Secretary of Defense (Telecommunications) sent a memorandum to the Services' senicr communicators requesting: "Your ccmments on the advisability and feasibility of using MCI metered use service...and like offerings are sclicited." [Ref. 45]. Apparently the Services paid some credence to the tasking, as there are a few more installations using SCC services ncw than there were at the time of the tasking.

Cne methcd, cf several being used (on a very limited basis) in the Department of Defense to procure SCC services, is through a strictly competitive procurement process. The Air Force is currently pursuing long distance telephone services this way. The Air Force Communications Command's Continental Communications Division has been publishing Requests for Quotaticn (RFQs) in the Commerce Business Daily as well as through the mail tc marketing representatives of the major carriers. The winner is determined, as in any cther contract, based on the quote provided by the carrier and cther factors which are weighted by the contracting office. Sc far only two bases have obtained services by this methcd; Kelly Air Force Base, Texas and Tinker Air Force Base, Oklahoma. Kelly Air Force Base replaced ten WATS lines (Service Area 5) and one intrastate Texas WATS line with 14 MCI WATS DALs in August 1983. As a result of

this change Kelly Air Force Base is spending less money for more circuits (and more capability since all of the MCI DALs are capable of completing calls within Texas) and the quality of the circuits is comparable to that had previously.[44]

The Navy is also getting underway with several activities in the San Diego area recently competitively procuring SCC services. While there is no Navy-wide guidance on obtaining SCC services, the Western Division of the Naval Facilities Engineering Command requires a minimum of three quotes from competing carriers.

Apparently not willing to accept the experience of other test areas, the Army plans to competitively procure SCC services to conduct its own test at an Army activity in the metropolitan St Louis area within the next several months. The Army is the slowest of the military services to implement SCC service usage.

Another method of procurement is for the base telecommunications manager to obtain the carriers' tariffs and other information describing their services and to perform his/her own evaluation to determine the least expensive and the best (or maybe a combination of both). This is the method used by the Defense Telephone Service-Washington (DTS-Washington). DTS-Washington first obtained MCI DALs in May 1979. Currently DTS-Washington has 102 MCI Network-only DALS, 209 WATS (Service Area 6) lines, and 65 FX lines for completing long distances calls.[45] This second method is reasonable since all of the carriers are tariffed and the

---

[44]Another Air Force installation, Offutt Air Force Base, is "testing" one DAL from both MCI and GTE Sprint--not an effective way, in the author's opinion, to test either cost savings or quality of service.

[45]DTS-Washington provides all administrative telephone service to all DoD components in the Washington, DC area. All long distance calls by DoD offices in the Washington, DC area are routed through the DTS-Washington electronic switch for least cost routing.

base telecommunications manager is capable of comparing rates and services. (In a sense, this method is competitive, too.) Thirty days is the standard minimum length of service required by the SCCs, so, unlike long term agreements, the risk in trying their services is minimal.

A third method is just to continue to allow AT&T to provide the service without regard to any competing carriers. This is by far the easiest method, but this method should become obsolete at all but the locations where there are no competing carriers.

3. Where to Go for Military Service Guidance and/or Assistance

Base telecommunications managers interested in obtaining SCC services should contact the appropriate office listed below for guidance and/or assistance.

D. SUMMARY

As has been presented in this chapter, SCC services appear like and function similar to AT&T MTS and WATS. There is sufficient evidence both inside and outside of the Department of Defense that shows that SCCs provide as good quality services which can be less expensive than those provided by AT&T. There should be no more need for testing SCC services. The military services must establish policies and provide direction to base telecommunications managers to begin the process of evaluating and, where feasible, procuring SCC services.

IV. ANALYSIS OF ALTERNATIVES

Having presented discussions in earlier chapters about the history of SCCs and the services they offer, this chapter provides, first, a general outline of questions which can be used in analyzing the use of SCC services at military installations.[47] Then, an actual case study is presented which evaluates the potential use of MCI and GTE Sprint services at Naval Air Station (NAS) Moffett Field, California. The final section of this chapter describes a computer program which was developed by the author for use in calculating the costs of using SCC dial access and dedicated access services from actual telephone bill data.

A. EVALUATING THE POTENTIAL USE OF SCC SERVICES

The first step that a base telecommunications manager must take to evaluate his/her installation for potential use of SCC services is to know what type of services the installation has and what the costs are for these services.[48] It is difficult to assess replacing or augmenting services without first knowing what is already in use. The next step is to determine if the installation is in an area served by an SCC. Do any of the SCCs have a switch serving this area or could the installation access SCC networks in a nearby city via an FX line or DAL? (Tables IV, V, VI, VIII, and IX show the origination cities for accessing the MCI and GTE

---

[47]This rationale can also be used to evaluate the potential use of reseller services, but since this thesis is about SCCs that exercise is left to the reader.

[48]This first step is useful even if there are no SCCs which offer services in the area (which is to be determined in the next step) as it will help the base telecommunications manager to see if there are other services offered by the incumbent carrier which may be cost saving.

Sprint networks.)[49] If not, there is no reason to continue the evaluation at this time, but considering the way that the SCCs are growing, a periodic re-evaluation is absolutely necessary. However, a base telecommunications manager should be skeptical about planned or projected SCC service in his/her area since a "projected" availability of service is never a sure thing until it actually becomes available.

Next the base telecommunications manager must answer the question, "What is the cost of accessing the SCC network?" Does the installation have a per call per minute charge (measured service or zone usage measurement service or other usage sensitive billing)? This charge will apply each time the local access number is called (for off-network access) **in addition to the long distance charges**. In fact, all calls which result in the SCC dial tone but result in a busy signal or otherwise uncompleted call will also incur these charges.[50] These costs are real and must be kept in mind in the evaluation. If the local access number is off an exchange in a nearby city, what will an FX line cost? What are the costs for a DAL to connect directly to the SCC network? Will installing DAIs permit removal of dial 9 trunks and, as a result, save the cost of these trunks? If local lines can be removed when installing FX lines or DALs these savings should be considered.

---

[49]If the specific location being evaluated is not listed, perhaps it is considered a part of a larger nearby city. For example: NAS Moffett Field is in Mountain View, California which is not listed in the SCC network lists of cities, but Palo Alto and San Francisco are.

[50]Self estimates that an **additional** 45 percent of the actual long distance connect time must be added to calls made during the Business Day rate period to account for these uncompleted long distance calls (as well as the time required to input the access code and telephone number to be called, the time spent waiting while ringing, etc.) [Ref. 46].

The next step is to determine if there is an economic advantage[51] (cost savings) by using SCC services for completing either all[52] or part[53] of the long distance calls placed by the military installation. First, what are the calling trends of the installation? (This may lead to some other considerations such as: calls placed to or near military installations that could be placed over AUTOVON; recurrent, periodic abuse; sufficient calls to nearby cities which may warrant considering installing an FX line other than to access the SCC network.) Second, what would it cost to complete the installation's long distance calls via the SCC services? Then, assuming that the cost of completing calls via the SCC is less than the existing method(s), is the cost of accessing the SCC's service (whether dial or dedicated) less than the difference?

Lastly, the base telecommunications manager must answer the question, "Are there any technical considerations that might affect the potential use of SCC services?" For example, can the installation's PBX accomodate additional trunks? To effectively use an SCC's network-only dedicated access service, least cost routing should be considered. Is least cost routing available on the PBX? A summary of these questions is listed in Table X.

---

[51]The computer program described in the following section of this chapter and which is listed in Appendix G can be very useful in this part of the evaluation.

[52]Can all of an installation's long distance calling needs be met solely by an SCC? In certain situations, yes. These situations are where no international, person-to-person, collect, third number, etc. calling is required. But as long as AT&T provides MTS service with no monthly service charges and no monthly minimums there is no reason not to have it handy just in case it's needed.

[53]If SCC services are used to supplement rather than replace existing WATS or dedicated access service, the base telecommunications manager should be aware that the hours which are shifted from the existing service are those hours which are in the lowest rate category. In other words, if 40 hours out of 120 hours per access line are shifted to another service, the 40 hours being shifted are those hours which were being charged at the over 80 hour rate.

TABLE X

Evaluating the Potential Use of SCC Services

- What type of long distance telephone services does the installation have, and what are the costs of these services?
- Does the SCC (or SCCs) have a switch serving this area or could the installation access the SCC network in a nearby city via an FX line or DAL?
- What is the cost of accessing the SCC network?
- Does the installation have a per call per minute charge (usage sensitive pricing--measured service or zone usage measurement service or other usage sensitive billing)?
- If the local access number is off an exchange in a nearby city, what will an FX line cost?
- What are the costs for a DAL to connect directly to the SCC network?
- Will installing DALs permit removal of dial 9 trunks, and as a result save the cost of those trunks?
- What are the calling trends of calls from the installation?
- What would it cost to complete the installation's long distance calls via the SCC services?
- If the cost of completing long distance calls via the SCC is less than the existing method(s), is the cost of accessing the SCC service less than the cost difference?
- Are there any technical considerations that might affect the potential use of SCC services?

B. A CASE STUDY OF NAS MOFFETT FIELD

The following case study evaluating the potential use of SCC services at NAS Moffett Field, California is provided to assist a base telecommunications manager in performing a similar analysis at his/her installation.

1. Type and Cost of Long Distance Service at NAS Moffett Field

NAS Moffett Field is located in Mountain View, Califcrnia which is in the metropolitan San Francisco area and is served by all of the majcr SCCs. The two biggest SCCs, MCI and GTE Sprint, were investigated as potential providers of long distance telephone service at NAS Moffett Field.

NAS Moffett Field has what is referred tc as POTS--Plain Old Telephone Service. No WATS lines.[54] Nc tie lines. Nc FX lines. Nothing fancy or exotic. Just MTS. Just POTS.

NAS Moffett Field is charged for zcne usage measurement service for calls in the local area.[55] The bill for long distance and zone usage measurement (ZUM) services is about $15,000 per month.

2. Cost of Accessing the SCC Network

The MCI and GTE Sprint local access numbers for NAS Moffett Field are Zone 1 calls (to Palo Alto, California). Calls to these networks (through dial access) would incur a ZUM charge cf $.03 per minute for the first minute and $.01 per minute for each additicnal minute during the Business Day rate period.[56] That's $.07 for a five minute call during

---

[54]In June 1983 Pacific Telephone reccmmended installation cf twc interstate WATS lines (service area 5) and three intrastate WATS lines (twc statewide WATS lines and cne Northern California WATS line). On 24 January 1984 NAS Moffett Field had the recommended number of lines installed. Since the telephone bill data being used for the case study is pre-WATS, this discussion will proceed as if they weren't installed.

[55]ZUM calls are local calls (within 16 miles) which are billed in zones with Zone 1 being the area closest tc the location where the call was originated. Zone 1 calls are lumped tcgether and appear on the monthly bill as totals for first and additicnal minutes in each rate period. Each Zcne 2 and Zcne 3 call is itemized.

[56]There is a 30 percent discount for calls made during

the business day just to connect to the SCC network, not to make the long distance call itself. Table XI compares the cost of a five minute call to the East Coast from Moffett Field via AT&T MTS, MCI Execunet, and SPRINT.

Since calls to the MCI Execunet and SPRINT networks are Zone 1 calls, FX lines need not be considered. The proximity of Moffett Field to the SCC switches permits easy installation of SCC DALs. Not considering installation charges or monthly usage minimums, an MCI Network-only DAL would cost $85 per month, an MCI WATS DAL would cost $100 per month, and a Direct Sprint DAL would cost $100 per month (from Table VII). Moffett Field is billed $.70 per month per each base telephone number for dial 9 trunks. This charge is independent of the number of trunks, therefore, the use of DALs will not affect this charge.

TABLE XI

Cost of a Five Minute Call from NAS Moffett Field to East Coast (Including Cost to Access SCC Network)

Carrier	Cost
AT&T MTS (Current Rates)	$2.70
AT&T MTS (Proposed Rates)	$2.45
MCI Execunet (Network City)	$2.23
SPRINT (Network City)	$2.32*

*Includes 8% discount for total bill $200 or over.

---

the Evening rate period, and a 60 percent discount for calls made during the Night and Weekend rate period. The rate periods for ZUM calls are the same as in Table II except the Night and Weekend rate period includes all day Sunday.

3. Calling Trends of NAS Moffett Field

The total cost of the installation's long distance and ZUM calls for the period between 20 September 1983 and 20 October 1983 was $17,990.16. There were 15,117 long distance calls at a total cost of $15,045.06. Of these calls, 1583 were interstate calls at a cost of $3424.02, nine were international calls (including to Canada) at a cost of $64.85, and the remainder were long distance calls within the state of California (1267 inter-LATA and 12,216 intra-LATA calls). The majority of Moffett Field's long distance calls are made to the eastern United States, primarily to Washington, DC, Maryland, Virginia, and New York, and, of course, within the state of California. There is also a need to call Hawaii and Alaska from Moffett Field.

4. Cost to Complete NAS Moffett Field's Long Distance Calls via SCCs

The computer program in Appendix G was used to analyze the cost of completing Moffett Field's interstate long distance calls. Twenty-one of the 1593 interstate calls were not used in the analysis because they were multiple rate period or operator assisted calls. The original cost of the remaining 1562 calls was $3348.41.

a. Dial Access Services

The costs calculated for placing these calls via AT&T MTS (proposed rates), MCI Execunet, and SPRINT are listed in Table XII. This table shows that, even (partially) considering the costs of calls to access the SCC networks, there is a significant potential cost savings by using SCC dial access services.

TABLE XII

Calculated Costs for Interstate Long distance Calls via Dial Access Services

Service	Cost	Percent Savings over AT&T MTS
Original AT&T MTS	$3348.41	-----
AT&T MTS (Proposed Rates)	$3010.79	10.1%
*MCI Execunet	$2655.92	20.7%
*MCI Execunet plus Cost of Call to Access	$2745.62	18.0%
SPRINT	$2686.04	19.8%
SPRINT plus Cost of Call to Access	$2776.73	17.1%

*Does not include eight calls to Alaska (134 minutes).

b. A Method of Estimating the Number of WATS lines or DALs Needed

The following paragraphs describe a method of estimating the number of WATS lines or DALs that may be needed.

An Erlang, a unit used to measure telephone traffic, is expressed in units of call hours per hour. An Erlang is related to CCS (hundred call seconds), another unit of traffic measurement, by a factor of 36 (1 Erlang = 36 CCS). (There are 3600 call seconds (36 CCS) in one hour.) A single telephone circuit can be in use a maximum of 1 Erlang (1 call hour per hour or 100 percent in use). The Erlang B equation is:

$$B = \frac{E^{N} / N!}{1 + E + E^{2} / 2! + \ldots + E^{N} / N!},$$

where B is the probability that N trunks are simultaneously busy with a traffic load of E Erlangs. B is also referred to as the grade of service as it can be viewed as an expression of how many calls out of 100 are not completed. For example, a B value of 0.05 means that five out of 100 calls are blocked, or there is a five percent probability that all trunks will be in use at any one moment in time. [Ref. 47]

To approximate the number of WATS lines or DALs that may be required if the total minutes of calling which occur during the busy hour is known:

1. Divide this number by 60 to obtain hours of calling in the busy hour. This value is in the same units as Erlangs.

2. Lcck up the value clcsest to this in the Erlang B tables found in Appendix F and read the required number of trunks for the desired grade of service.[57]

To calculate an approximation of the total minutes cf calling in the busy hour and the number of WATS lines or DAIs that may be required:

1. Take the total number of minutes of calling during the Business Day rate period for a month.
2. Divide this number by 60 to obtain hours of calling.
3. Divide the result by 22 (average number of business days in one mcnth) to obtain average hours of calling per business day.
4. Multiply this number by .17 (an approximation that 17 percent of all calls made during the business day (8 hcurs) occur during the busy hour) to obtain hours of calling during the busy hour.[58] This value is in the same units as Erlangs.
5. Lcck up the value clcsest to this in the Erlang B tables (Appendix F) and read the required number of trunks for the desired grade of service.

An example of the second method is shown next, using the data from NAS Moffett Field's interstate calls. There were 5157 minutes of calls placed during the Business Day rate period. This is ccnverted to hours as follows:

$$\frac{\text{5157 minutes}}{\text{60 minutes/hour}} = 85.95 \text{ hours.}$$

---

[57]Smith suggests that a grade of service of .005 is a typical practical value [Ref. 48]. The standard for the AUTOVCN system is a grade of service of .05 (for inward calling), but there are many installations throughout the Department of Defense with much worse grades of service. Remember that this grade of service is based on the busiest hour of usage during the day--so it represents worst case.

[58]If the base telecommunications manager feels that service is more or less peak loaded than this, the .17 can be increased or decreased. This should be changed only if the manager feels competent at traffic measurement and management.

Next, the number of hours of calling during the business day are calculated.

$$\frac{89.95 \text{ hours}}{22 \text{ bus. days/month}} = 3.91 \text{ hours/bus. day.}$$

The number of hours during the busy hour are calculated as follows:

$$3.91 \text{ hours/bus. day} \times .17 = .66 \text{ hours/busy hour. (Erlangs)}$$

One, two, three, and four lines will provide grades of service of .375, .101, .020, and .003, respectively, with .60 Erlangs of traffic during the busy hour (from Appendix F).

c. Dedicated Access Services

The costs calculated for completing Moffett Field's interstate long distance calls via AT&T WATS, MCI WATS, and Direct Sprint, based on using three access lines, are listed in Table XIII. Costs calculated for four access lines are found in Table XIV.

Tables XIII and XIV show that the SCC dedicated access services can save over 30 percent of the cost of completing the calls via AT&T MTS (current rates) and over 20 percent of the calculated cost of completing the calls via AT&T WATS (current rates). That's an impressive potential savings.

TABLE XIII

Calculated Costs for Interstate Long Distance Calls via Dedicated Access Services (Three Access Lines)

Service*	Cost	Percent Savings over AT&T MTS	Percent Savings over AT&T WATS (Current Rates)
Original AT&T MTS	$3348.41	-----	-----
AT&T WATS (Current Rates)	$2735.95	18.3%	-----
AT&T WATS (Proposed Rates)	$2260.08	32.5%	17.4%
**MCI WATS	$2111.76	36.9%	22.8%
Direct Sprint	$2145.04	35.9%	21.6%

*AT&T WATS, MCI WATS, and Direct Sprint costs are based on using three access lines which are calculated to provide a grade of service of .025 during the busy hour. The costs include the per line monthly recurring charges but not order or installation charges.

**Does not include eight calls to Alaska (134 minutes).

TABLE XIV

Calculated Costs for Interstate Long Distance Calls via Dedicated Access Services (Four Access Lines)

Service*	Cost	Percent Savings over AT&T MTS	Percent Savings over AT&T WATS (Current Rates)
Original AT&T MTS	$3348.41	-----	-----
AT&T WATS (Current Rates)	$2810.20	16.1%	-----
AT&T WATS (Propcsed Rates)	$2350.63	29.8%	16.4%
**MCI WATS	$2238.11	33.2%	20.4%
Direct Sprint	$2243.91	33.0%	20.2%

*AT&T WATS, MCI WATS, and Direct Sprint costs are based on using four access lines which are calculated to provide a grade of service of .004 during the busy hour. The ccsts include the per line monthly recurring charges but nct crder or installation charges.

**Dces nct include eight calls to Alaska (134 minutes).

d. Intrastate Calling

Although this case study was oriented toward evaluating the costs of completing interstate calls via MCI and GTE Sprint services, intrastate calls could be completed via these services as well. As stated in the previous chapter, MCI will complete calls within the state (California) only if they terminate on their network, and GTE Sprint will complete all calls within the state. Pacific Bells's rates for intrastate calls are such that nearly all calling to locations more than 40 miles away is less expensive via MCI Execunet, MCI Network Service (without Universal Termination), SPRINT, or Direct Sprint (to network cities). For Direct Sprint to non-network cities, the distance must be greater than 110 miles before a call is less expensive than via Pacific Bell.[59] Therefore, at Moffett Field most intra-LATA calls would probably be less expensive to complete via Pacific Bell[60] and inter-LATA calls would be less expensive via the SCCs.[61]

Exactly how much can be saved by completing intrastate calls via SCCs was not determined. It is reasonable to assume that some cost savings would result but, unless the installation has (or can obtain) least cost routing, the telephone user would have too many decisions to make for completing a call.

---

[59]These comparisons are based on a five minute call during the Business Day rate period and, for MCI Network Service and Direct Sprint, an average use per line in the Business Day rate period of less than 900 minutes.

[60]For many installations, some intra-LATA calls will be less expensive if placed via the SCCs since some locations within the LATA may be rather distant.

[61]A semi-random inspection of the inter-LATA calls on Moffett Field's telephone bill showed that about 70 percent of these calls could be completed on MCI's network.

5. Technical Considerations

The Centrex system at Moffett Field has room for additional trunk terminations and least cost routing is available (for a price, of course) if the installation desires to take advantage of this capability to make the routing choices for the telephone user. There are no other known technical considerations at NAS Moffett Field.

C. A COMPUTER PROGRAM USED TO CALCULATE COSTS OF USING SCC SERVICES

The computer program in Appendix G was created by the author to analyze the costs of completing interstate calls via AT&T MTS and WATS (at current and proposed tariff rates), MCI Execunet and MCI WATS, and SPRINT and Direct Sprint. A description of this program is given below.

1. Computer Program Description

Basically, this program takes telephone bill data and calculates the cost of each call as if it were made via AT&T (with current and proposed rates), MCI, and GTE Sprint. It was written for interactive computing using the WATFIV facilities of the IBM 3033 at the Naval Postgraduate School.

Files containing listings of area codes and prefixes that are on the MCI and GTE Sprint networks are read into an array. This permits comparison with the area code and prefix of a telephone call (from the input data) to determine if that area code and prefix are on the SCC networks.

Telephone bill data for a one month period is read from a file[62] into an array (actually several arrays) and

---

[62]The format of the telephone call data in the input file was arbitrarily chosen since the data used for the case study in the previous section of this chapter was entered manually from the telephone bill. The computer program can easily be modified to accept data from magnetic tapes. (After obtaining and processing three magnetic tapes with

sorted by area code and prefix to permit a readable output, if output is requested for each call. Data for calls outside of the United States (all 50 States and the District of Columbia), in multiple rate periods, or in a rate class other than direct dial (i.e., person-to-person, station-to-station, collect, third party, etc.) is automatically rejected.

The program calculates the distance (actually a range of distances) to the called number for each call from the duration, rate period, and cost of the call.[63] Data for calls for which the distance calculation does not properly calculate a distance is also rejected.

Costs of completing each call via AT&T MTS (proposed rates), MCI Execunet, and SPRINT are calculated based on the duration, rate period, distance (range of distances) to called number, and, for MCI Execunet, whether it is a network or non-network call. Also, the minutes of calls which occur within each rate period to network and non-network locations are summed for use in calculating the WATS and dedicated access services costs. This program will account for the cost of a call to access MCI Execunet and SPRINT, based on first minute and additional minute rates. Costs for each individual call are calculated and can be output, if the user desires. The results can be output as total costs for all calls or the costs of each call can be output individually followed by total costs for all calls. Figure 4.1 shows the interactive queries and responses which produced the ouput shown in Figure 4.2.

---

only a handful of calls on each, the author resorted to the manual input method. The author **highly** recommends inputting the telephone bill data from magnetic tape.)

[63]Common carriers actually calculate the distance to the called number from the coordinates of the calling and called locations, requiring a very large data base.

```
DO YOU WANT OUTPUT FOR EACH CALL? (Y OR N)

```

Figure 4.2 (Continued) An Example of the Computer Program Output.

Since charges for the dedicated access services (AT&T WATS, MCI Network Service with Universal Termination (MCI WATS), and Direct SPRINT) are based on average usage per line, the total number of WATS lines or DALs must be entered. The computer program estimates the Erlangs of call traffic during the busy hour (using the second method of approximating the number of WATS lines or DALs described in the previous section of this chapter) and displays the calculated numbers of lines and grades of service on the visual display terminal to allow the user to decide how many access lines should be used in the WATS and dedicated access services cost calculations. If the user desires, a range of numbers of access lines may be entered and calculations will be performed and results given for each number of access lines in the range of numbers. Also, if the user desires, the number of access lines which is used in the calculation can be an existing or carrier-proposed number of WATS lines or DALs or a number derived from any reliable source.

2. Computer Program Assumptions and Limitations

The following are assumptions and limitations of the program:

- This program can be used only for calculating costs of calls (via AT&T MTS and WATS, MCI Execunet and MCI WATS, and SPRINT and Direct Sprint with Universal Calling) originated within the continental United States (CONUS) and completed to CONUS, Hawaii, and Alaska. It also assumes that the user knows if the location being evaluated is in an area which permits originating calls via these services.

- Telephone bill data from a one month period is used for the input data. (The user should consider using an average month's bill and a peak month's bill to evaluate the costs and number of WATS and DALs for average and peak months of

telephone usage in order to determine if there is a significant difference.)

- Tenths of a cent are truncated from the costs calculated for each AT&T MTS call and are rounded for each MCI Execunet and SPRINT call.

- Since calls to Hawaii made via AT&T MTS are billed by Band and not by mileage (see Appendix E), the program converts Bands to mileage ranges for use in calculating the costs via the other carriers. The correctness of these conversions has not been determined except for the West Coast.

- Costs for calls made via dial access services (MCI Execunet and SPRINT) in the 56-70 and 71-124 mile distance ranges are calculated using the rates for the 71-124 mile range since AT&T MTS has only a 56-124 mile range (and the distance (range of distances) to the called number is calculated from the duration, rate period, and cost of the original AT&T MTS call).

- Costs for calls made via MCI Execunet over 3000 miles are calculated using the rates for the 1911-3000 mile range since there is no rate shown in the tariff for distances greater than 3000 miles.

- Costs for calls made via SPRINT are calculated using the rates which are discounted for over $200 usage per month.

- The program calculates the costs of accessing the dial access services, if any, using first minute and additional minute rates, the rate periods in Table II, and only the duration of the completed long distance call.

- Since original call data is in one minute increments, WATS and dedicated access service cost calculations do not

consider the less than one minute increments used by these carriers or the one minute minimum average time requirement of these carriers.

- WATS and dedicated access service cost calculations include the monthly recurring charges per access line but not order or installation charges. The monthly recurring charges used in the program are the basic charges which assume that the installation is close enough to the carrier's point of termination so as to avoid additional mileage charges.

- Costs for AT&T WATS (current tariff) are calculated using Service Area 6 rates. The rates used for calculating costs of AT&T WATS (proposed tariff) are for Service Areas 5 and 6 (which have the same rates).

- The program does not round the total hours of calls in each rate period to the nearest tenth of an hour for AT&T WATS cost calculations.

- Costs are calculated for dedicated access services with "Universal Termination" (MCI WATS and Direct Sprint with Universal Calling), and not for network-only termination service.

V. SUMMARY AND RECOMMENDATIONS

A. SUMMARY

1. Specialized Common Carriers--A History

Following an introductory chapter, the second chapter of this thesis presents a brief history of Specialized Common Carriers (SCCs). Several Federal Communications Commission (FCC) actions were particularly significant in preparing the way for SCCs; the 1959 and 1960 **Above** 890 decisions, the 1968 **Carterfone** decision, the 1969 **MCI** decision, and the 1971 **Specialized Common Carrier** decision.

The **Above** 890 decisions opened the microwave field to private firms and individuals allowing them to install microwave systems utilizing the frequency spectrum above 890 MHz for their own use. Since the FCC prohibited sharing facilities and systems, this decision did not allow competition with established common carriers.

The **Carterfone** decision required the Bell System to permit interconnection of non-Bell equipment as long as the interconnection would not harm the system or disrupt the ability of others to use the system.

In 1963, Microwave Communications, Incorporated (MCI) applied for FCC certification for public common carrier point-to-point microwave service between Chicago and St Louis and intermediate points. After several years, and in spite of vigorous opposition by AT&T, General Telephone, Illinois Bell, Southwestern Bell, and Western Union, the FCC approved this application in 1969 in what is called the **MCI** decision.

By 1971 there were applications on file with the FCC for 1,977 microwave stations in 46 separate proposals from 33 new carriers. To avoid reviewing each of these applications individually, the FCC opened the SCC field to open competition in their June 1971 Specialized Common Carrier decision.

While SCCs continue to offer private line point-to-point service, which is what the FCC Specialized Common Carrier decision originally permitted them to provide, they are now making their money by offering long distance, switched network services in direct competition with AT&T. Revenues in 1983 from the long distance services provided by MCI, GTE Sprint, and ITT United States Transmission Systems (USTS) totaled $2.44 billion, seven percent of AT&T's $35 billion. Analysts predict that this may increase to 10 to 20 percent of a more than $100 billion per year industry by 1990.

2. Specialized Common Carrier Switched Voice Network Services

Chapter III describes MCI and GTE Sprint dial access and dedicated access services, discussing the costs, additional features, advantages, and disadvantages of these services. Dial access service is similar to AT&T's MTS (without operator assistance). A customer dials a local access (telephone) number and a billing code to access the SCC, and, finally, the desired number to be called. Calls via MCI Execunet and GTE Sprint's SPRINT can be originated only in a limited, but large and growing, number of locations. Both services offer "Universal Termination" which permits completing calls to non-network cities. Billing is based on the duration of the call, rate period, distance to called number, and whether to a network or non-network city. MCI and GTE Sprint offer least cost routing, group billing,

speed dialing, travel/credit card service, and magnetic tape billing as additional features with their dial access services.

Dedicated access service is the SCC's marketing answer to AT&T's WATS. The customer accesses the SCC network through a dedicated access line (DAL), eliminating the need to dial the local access number or billing code. Again, calls via these services can be originated only from specific areas. MCI Network Service and Direct Sprint allow calling only to network cities, while calls made via MCI Network Service with Universal Termination (MCI WATS) and Direct Sprint with Universal Calling can be completed to non-network cities. Both companies bill their dedicated access services based on average use per line per rate period to network or non-network cities. Also, both have a one minute minimum average time requirement. Least cost routing, accounting codes, and magnetic tape billing are additional features offered with these services.

While SCCs are interstate carriers, the AT&T divestiture agreement mandated that long distance service between LATAs would be provided by AT&T and other carriers like the SCCs. So far, SCCs have been authorized to offer (at least partial) intrastate calling in six states. Potential SCC users must check with the SCCs concerning their service offerings in a particular state.

SCC use throughout the Department of Defense is currently limited to just a handful of places. The Department of Defense should be concerned because there is money to be saved. According to MCI:

> ...While we have been unable to obtain an accurate figure for DoD's current cost for [administrative long distance telephone services,] estimates place these costs at a minimum of $500 million annually. The potential savings may be as high as $125 million annually....

One method, of several being used (on a very limited basis) in the Department of Defense to procure SCC services, is through a strictly competitive procurement process. Using this method, Kelly Air Force Base, Texas replaced ten WATS lines (Service Area 5) and one intrastate WATS line with 14 MCI WATS DALs in August 1983. As a result of this change Kelly Air Force Base is spending less money for more circuits (and more capability since all of the MCI DALs are capable of completing calls within Texas) and the quality of the circuits is comparable to that had previously.

Another method is for the base telecommunications manager to obtain the carriers' tariffs and other information describing their services and to perform his/her own evaluation to determine the least expensive and best carrier.

A third method is just to continue to allow AT&T to provide the service without regard to any competing carriers. This method should be used only at locations where there are no competing carriers.

The offices which base telecommunications managers should contact for guidance and/or assistance on obtaining SCC services are listed in the chapter.

3. Analysis of Alternatives

Chapter IV outlines a method of evaluating the potential use of SCC services at military installations and applies this method in a case study evaluating the potential use of MCI and GTE Sprint services at Naval Air Station Moffett Field, California. Table XV is a summary of the questions that a base telecommunications manager must answer in evaluating SCC usage at his/her installation.

The case study shows a potential cost savings of about 20 percent using MCI and GTE Sprint dial access services and over 30 percent using their dedicated access

TABLE XV

Evaluating the Potential Use of SCC Services

- What type of long distance telephone services does the installation have, and what are the costs of these services?
- Does the SCC (or SCCs) have a switch serving this area or could the installation access the SCC network in a nearby city via an FX line or DAL?
- What is the cost of accessing the SCC network?
  - Does the installation have a per call per minute charge (usage sensitive pricing--measured service or zone usage measurement service or other usage sensitive billing)?
  - If the local access number is off an exchange in a nearby city, what will an FX line cost?
  - What are the costs for a DAL to connect directly to the SCC network?
  - Will installing DALs permit removal of dial 9 trunks, and as a result save the cost of those trunks?
- What are the calling trends of calls from the installation?
- What would it cost to complete the installation's long distance calls via the SCC services?
- If the cost of completing long distance calls via the SCC is less than the existing method(s), is the cost of accessing the SCC service less than the cost difference?
- Are there any technical considerations that might affect the potential use of SCC services?

services for completing long distance calls at Moffett Field. Exactly how much could be saved by completing intrastate calls via SCCs was not determined, but at Moffett Field most intra-LATA calls would probably be less expensive to complete via Pacific Bell and inter-LATA calls would be less expensive via the SCCs.

The last section of this chapter describes a computer program (in Appendix G) which was created by the

author to analyze the costs of completing interstate calls (originated within the continental United States (CONUS) and completed to CONUS, Hawaii, and Alaska) via AT&T MTS and WATS (at current and proposed tariff rates), MCI Execunet and MCI WATS, and SPRINT and Direct Sprint. Basically, this program takes telephone bill data and calculates the cost of each call as if it were made via AT&T (with current and proposed rates), MCI, and GTE Sprint. It was written for interactive computing using the WATFIV facilities of the IBM 3033 at the Naval Postgraduate School. Figures giving examples of the interactive queries and user responses and the outputted results are provided in the chapter. Assumptions and limitations of the computer program are also presented.

SCCs are rapidly growing competitors in a multi-billion dollar long distance telecommunications market. They are viable alternative long distance carriers for military installations. Several military installations are currently using SCC services and receiving excellent service at less cost than for comparable AT&T offerings. More installations must evaluate the potential use of SCC services and begin realizing the cost savings that are currently possible.

B. RECOMMENDATIONS

The Department of Defense and the Military Services must provide guidance to base telecommunications managers on procuring and using SCC services. A restatement and reemphasis of the federal government's policy on competitive procurement of local telecommunications services, including long distance services, by the Office of the Secretary of Defense is in order. Military Service regulations and instructions must state the Service's policy on the use of SCC services and provide guidance on methods of procurement.

Training on long distance alternatives should be included in base telecommunications manager training programs such as the Air Force's Basic and Staff Telecommunications Officer courses at the Keesler Technical Training Center, Keesler Air Force Base, Mississippi. Also, a primer on SCCs, such as this thesis, should be published and made available to all base telecommunications managers in the United States.

NAS Moffett Field should seriously consider using SCC services due to the significant potential cost savings that could be realized as shown by the case study.

Several thesis research topics are suggested by this study:

- Long distance resellers--history, regulation, and services.

- (Adequacy of) Department of Defense and Military Service guidance on procurement and use of telecommunications services.

- Use of microcomputers to analyze the use of SCC and/or reseller services at military installations.

- An analysis of the economic feasibility of the use of dynamic least cost routers and software defined systems.

- Additional research on the topic of this thesis to include:

  - Modifying the computer program to calculate the installation's busy hour and hours of calling during the busy hour from time of day and duration of call data. Also, use of the computer program to provide more statistical information about the installation's monthly telephone bill, i.e., total cost of calls within each area code.

  - Implementation of SCC services at an installation which has been evaluated using the computer program and

subsequent monitoring to see if the evaluation was an accurate estimation of cost savings to be realized using SCC services.

APPENDIX A

CHRONOLOGY OF SPECIALIZED COMMON CARRIERS

1959/1960 - FCC Above 890 decisions allowing private microwave systems to be developed using the frequency spectrum above 890 MHz.

1963 - MCI applied to FCC for microwave link between St Louis and Chicago.

1968 - FCC Carterfone decision allowing connection of non-Bell telephone equipment to the telephone system.

August 1969 - FCC MCI decision authorized MCI to provide private line microwave service between St Louis and Chicago.

November 1969 - Datran Transmission Co. (DATRAN) applied to FCC for microwave system linking 35 metropolitan areas with a switched circuit high-speed data network.

July 1970 - FCC staff recommended policy of open Specialized Common Carrier competition.

October 1970 - Justice Department urged FCC to adopt policy of open competition in Specialized Common Carrier field.

May 1971 - FCC Specialized Common Carrier decision opened Specialized Common Carrier field to competition.

1972 - MCI authorized by FCC to build New York to Chicago microwave link. DATRAN authorized by FCC to begin construction on its microwave system between 35 major cities.

February 1973 - Southern Pacific Communications Co. (SPC) authorized by FCC to begin building its microwave network.

July 1973 - ITT's United States Transmissions Systems, Inc. (USTS) applied to FCC to build a microwave network between New York and Houston via Philadelphia, Washington, DC, and Atlanta.

October 1973 - AT&T petitioned the FCC to stop licensing Specialized Common Carriers.

September 1974 - ITT's USTS authorized by FCC to build microwave network.

May 1975 - AT&T objected to MCI sales of long-distance type voice service with Execunet stating that it was outside the FCC authorization for MCI to provide private line service.

July 1975 - FCC ruled MCI Execunet service did not fit the definition of private-line service, which was what MCI was authorized to provide.

July 1976 - FCC reaffirmed its ruling that MCI's Execunet was not lawful.

August 1976 - DATRAN decided to end operations and filed for bankruptcy.

1976 - MCI and SPC filed with FCC to offer switched voice network services: Switched Private Line Service and SPRINT, respectively.

July 1977 - Court of Appeals reversed FCC decision on the legality of MCI's Execunet service.

1978 - ITT's USTS filed to offer switched voice network service City-Call.

October 1980 - FCC approved resale of Wide Area Telecommunications Service (WATS) by other common carriers.

June 1981 - Northwest Iowa Telephone Co. offered MCI long-distance calling to all its customers.

January 1982 - U. S. Department of Justice and AT&T agreed to drop government's 1974 anti-trust charges and 1956 anti-trust settlement barring AT&T from engaging in unregulated business. AT&T agreed to divest itself of 22 local Bell operating companies.

November 1982 - MCI announced plans to test the use of cable TV for telephone service in Omaha, Nebraska.

December 1982 - MCI bought railroad rights of way to install fiber optic cable.

February 1983 - MCI arranged to buy two satellite transponders.

June 1983 - GTE Corporation acquired SPC and formed GTE Sprint.

APPENDIX B
GLOSSARY OF TERMS

Area Code - A three digit code which precedes the NNX code or prefix and is used for calling from one geographical area to another. Also known as Number Plan Area (NPA).

Automatic Voice Network (AUTOVON) - A worldwide switched voice network used by the Department of Defense.

Busy Hour - The peak 60 minute period of telephone usage during the day.

Centrex - A PBX in which incoming calls are dialed direct to the extensions without operator assistance. Centrex CU has switching equipment on-premise with the switchboard. Centrex CO has switching equipment in the commercial telephone exchange (Central Office).

Communications Common Carrier - A company which provides communications services, or classes of communications services to the public and whose services and rates are subject to public regulation.

Dedicated (or Direct) Access Line (DAL) - A circuit connecting a phone system directly to the terminal of a long distance carrier. A WATS lines is a DAL to AT&T Long Lines.

Dial 9 Trunk - Dial Access Central Office Trunk - A direct circuit between a PBX and a telephone Central Office to which all stations have access by dialing a given digit (9).

Direct Distance Dialing - An AT&T service which permits the telephone user to dial his/her own long distance telephone calls without operator assistance.

Dual Tone Multi-Frequency (DTMF) Signalling - A signalling method which uses combinations of two frequencies to indicate telephone number digits (and precedence, in the case of AUTOVON). Also known as touch tone dialing.

Foreign Exchange Line (FX) - A trunk, paid for on a flat monthly rate, connecting a PBX to a remote telephone exchange.

Least Cost Routing - Also referred to as Automatic Route Selection (ARS) and Route Optimization - Automatic selection of the most economical route for an outgoing call.

Least Cost Routing Device - An electronic device which routes a call over the most economical telecommunications path available.

Line - A common term used to denote any circuit connecting two or more telecommunications devices.

Local Access Number - A telephone number which is dialed to access an SCC switch to make calls via the SCC's network.

Local Access and Transport Area (LATA) - A geographical area within which a telephone company may provide "local" service. There are 161 LATAs. Idaho, Maine, New Mexico, and the District of Columbia each have one LATA for the entire state or district. All other states have more than one LATA.

Message Telecommunications Service (MTS) - Long Distance Message Telecommunications Service (LDMTS) - AT&T's composite service of direct distance dialing (DDD) and operator assisted calling.

Minimum Average Time Requirement (MATR) - A requirement that the average duration of calls placed via a carrier's service must be at least a specified minimum. AT&T WATS, MCI WATS, and Direct Sprint each have a one minute minimum average time requirement.

NNX Code - The first three digits of a seven digit telephone number.

Other Common Carrier (OCC) - A communications common carrier other than AT&T.

Plain Old Telephone Service (POTS) - Ordinary long distance telephone service (AT&T MTS).

Prefix - The first three digits of a seven digit telephone number.

Private Branch Exchange or Private Automatic Branch Exchange (PBX) - A private phone system connected to the public telephone network which permits internal routing and switching of calls.

Private Line - A point-to-point circuit with no connection to a PBX or network. Usually a special circuit such as a fire or guard telephone, or a circuit used to interconnect computers.

Rotary or Pulse Dial - A signalling method which generates pulses (a pulse being defined as a single impulse of a telephone dial) to indicate telephone digits.

Service Areas - A geographical area within which AT&T WATS calls may be completed (outward WATS) or originated (inward WATS). Interstate WATS is offered in the form of six geographical areas called Service Areas (formerly Bands). Service Area 1 includes the states adjacent to the state in which the call is originated and each higher numbered Service Area adds a larger geographical area to the lower numbered Service Area(s). Service Area 5 WATS permits calling to anywhere within the continental United States (outside of the state in which the call was originated). Service Area 6 adds Alaska and Hawaii.

Specialized Common Carrier (SCC) - A communications common carrier offering telecommunications services between two or more points to large volume users.

Switched Network - A network consisting of customers or subscribers connected to switching centers (central offices) which are interconnected by a series of other switches. Rather than using a full-time physical connection between two users or locations (such as a private line), a call is completed via temporary connections between switching centers and switches.

Tariff - The published rate for a specific unit of equipment, facility, or type of service provided by a communications common carrier.

Tie Line - A direct circuit between two PBXs.

Trunk - A circuit between switchboards or PBXs or between a switchboard/PBX and a telephone Central Office.

Universal Termination - An SCC term for the capability to call any location in the continental United States and some other locations from specific cities that are on the SCC network. Sometimes referred to as Universal Calling.

Usage Sensitive Pricing - A pricing system that charges for calls based on one or more of the following: duration of call, rate period, mileage, or total usage.

Wide Area Telecommunications Service (WATS) - An AT&T service which provides a special line allowing the subscriber to make calls to any location within a specific zone or Service Area on a direct distance dialing basis at a reduced rate.

APPENDIX E
AT&T, MCI, AND GTE SPRINT TARIFF RATES

Tariff rates for AT&T MTS (current and proposed), MCI Execunet, and GTE Sprint's SPRINT appear first in this appendix followed by the tariff rates for AT&T WATS (current and proposed), MCI WATS, and Direct Sprint. Methods of applying the tariffs are described below.

AT&T MTS, MCI Execunet, and SPRINT

AT&T MTS and SPRINT charges are based on a rate for the first minute plus a rate for additional minutes in each rate period, while MCI Execunet has a single rate for all minutes in a rate period. All of these services round up the duration of the call to the next higher minute--they bill in one minute increments. AT&T MTS costs are calculated at the day rate, regardless of rate period, then discounted according to the rate period in which the call was made. (The discounts are 40 percent for the Evening rate period and 60 percent for the Night and Weekend rate period. A 55 percent discount is applied to calls to Alaska and Hawaii during the Night and Weekend rate period under the current tariff.) SPRINT service is discounted based upon total dollar amount of the bill. (See the SPRINT rate table below.) MCI Execunet has separate rates for calls to network and non-network cities. Tenths of a cent are truncated from the costs calculated for each AT&T MTS call and are rounded for each MCI Execunet and SPRINT call.

AT&T WATS, MCI WATS, and Direct Sprint

AT&T WATS measures the duration of a call in one second increments, MCI WATS uses thirty second increments, and Direct Sprint uses six second increments. All three of

these services have a one minute minimum average time requirement. Also, all three have the same points at which the rates taper; 15, 40, and 80 hours (or equivalent minutes). Costs are calculated based on average use per line per rate period. In other words, the total usage in each rate period for all lines (WATS lines or DALs) is divided by the number of lines to obtain an average use per line per rate period. (AT&T WATS rounds this average to the nearest tenth of an hour.) MCI WATS and Direct Sprint also calculate the average for calls to network and non-network cities. (See rate tables below.) The average use per line per rate period and the per line monthly recurring charges are used to calculate the cost per line. The cost per line is multiplied by the total number of lines to obtain the total cost. An example follows:

Two AT&T WATS lines (Service Area 6) are used as follows during a one month period:

Rate Period	Hours
Business Day	100
Evening	40.45
Night and Weekend	10

The average use per line per rate period is:

Rate Period	Hours
Business Day	100 / 2 = 50
Evening	40.45 / 2 = 20.225 (rounded to the nearest tenth of an hour = 20.2)
Night and Weekend	10 / 2 = 5

The cost per line per rate period (assuming rate step 20 for Service Area 6 calling from California for AT&T WATS (current rates)) is:

Business Day Rate Period (50 hours total per line average)

15 hours X $25.82	= $387.30
25 hours X $22.98	= $574.50
10 hours X $21.03	= $210.30
Total	$1172.10

Evening Rate Period (20.2 hours total per line average)

15	hours	X $16.78	= $251.70
5.2	hours	X $14.94	= $ 77.69
		Total	$329.39

Night and Weekend Rate Period (5 hours total per line average)

5 hours X 9.04 = $ 45.20

Total cost per line:

Business Day Rate Period	$1172.10
Evening Rate Period	$ 329.39
Night and Weekend Rate Period	$ 45.20
Per line Monthly Recurring Charges	$ 31.65
Total Cost per line	$1578.34

Total cost:

$1578.34 per line X 2 lines = $3156.68

The process is the same for MCI WATS and Direct Sprint except the average use per line per rate period is not rounded.

APPENDIX G

COMPUTER PROGRAM LISTING

```
$JOB            ID,NOIIST,NARR,L=80
C*****************************************************************
C
C     THIS PROGRAM WAS CREATED BY SCOTT L. KLINGLER, CAPTAIN, USAF IN
C     MARCH 1984.  IT WAS WRITTEN FOR INTERACTIVE COMPUTING USING THE
C     WATFIV FACILITIES OF THE IBM 3033 AT THE NAVAL POSTGRADUATE
C     SCHOOL.  ADDITIONAL INFORMATION ABOUT THIS PROGRAM CAN BE
C     OBTAINED IN KLINGLER, SCOTT L., SPECIALIZED COMMON CARRIERS:
C     ICNG DISTANCE AITERNATIVES FOR MILITARY INSTALLATIONS, MASTER'S
C     THESIS, NAVAL POSTGRADUATE SCHOOL, MONTEREY, CA, MARCH 1984.
C
C*****************************************************************
C*****************************************************************
C
C     THIS PROGRAM PERFORMS THE FOLLOWING FUNCTIONS:
C
C        1.  PUTS AREA CODES AND PREFIXES OF SPECIALIZED COMMON
C            CARRIER (SCC) NETWORKS FROM FILES INTO AN ARRAY NUM
C
C        2.  COMPARES CALLED NUMBER (AREA CODE AND PREFIX) TO SCC
C            NETWORKS.  (NOTE: IF AREA CODE IS NOT ONE OF THOSE LISTED
C            IN DO 10 (ALL AREA CODES IN UNITED STATES) DATA FOR THE
C            CALLED NUMBER WILL BE REJECTED.)
C
C        3.  CALCULATES DISTANCE (RANGE OF DISTANCES) TO CALLED CITY FROM
C            THE DURATION, RATE PERIOD, AND ORIGINAL COST OF THE CALL.
C            (NOTE: IF DISTANCE WILL NOT CALCULATE (DUE TO INCORRECT
C            DATA, MULTIPLE RATE PERIOD, DISTANCES FURTHER THAN LONGEST
C            RANGE OF DISTANCES ALLOWED IN PROGRAM, ETC.) CALL DATA WILL
C            BE REJECTED.)
C
C        4.  CALCULATES CHARGES FOR MTS-TYPE CALLS (DIAL ACCESS SERVICE
C            - AT&T MTS, MCI EXECUNET, AND SPRINT) BASED ON DURATION OF
C            CALL, RATE PERIOD, AND MILEAGE AND TOTALS MINUTES OF CALLS
C            IN EACH RATE PERIOD TO NETWORK AND NON-NETWORK CITIES.
C
C        5.  CALCULATES CHARGES FOR WATS-TYPE CALLS (DEDICATED ACCESS
C            SERVICE - AT&T WATS, MCI WATS (NETWORK SERVICE WITH UNIVERSAL
C            TERMINATION), AND DIRECT SPRINT) BASED ON THE AVERAGE TIME
C            PER ACCESS LINE PER RATE PERIOD.
C
C*****************************************************************
C
C     ASSUMPTIONS AND LIMITATIONS
C
C    *  THIS PROGRAM CAN BE USED ONLY FOR CALCULATING COSTS OF CALLS (VIA
C    AT&T MTS AND WATS, MCI EXECUNET AND MCI WATS, AND SPRINT AND DIRECT
C    SPRINT WITH UNIVERSAL CALLING) ORIGINATED WITHIN THE CONTINENTAL
C    UNITED STATES (CONUS) AND COMPLETED TO CONUS, HAWAII, AND ALASKA.
C    IT ALSO ASSUMES THAT THE USER KNOWS IF THE LOCATION BEING EVALUATED
C    IS IN AN AREA WHICH PERMITS ORIGINATING CALLS VIA THESE SERVICES.
C
C    *  TELEPHONE BILL DATA FROM A ONE MONTH PERIOD IS USED FOR THE
C    INPUT DATA.  (THE USER SHOULD CONSIDER USING AN AVERAGE MONTH'S
C    BILL AND A PEAK MONTH'S BILL TO EVALUATE THE COSTS AND NUMBER OF
C    WATS AND DEDICATED ACCESS LINES (DALS) FOR AVERAGE AND PEAK MONTHS
C    OF TELEPHONE USAGE IN ORDER TO DETERMINE IF THERE IS A SIGNIFICANT
C    DIFFERENCE.)
C
```

```
C     *  TENTHS OF A CENT ARE TRUNCATED FROM THE COSTS CALCULATED FOR EACH
C     AT&T MTS CALL AND ROUNDED FOR EACH MCI EXECUNET AND SPRINT CALL.
C
C     *  SINCE CALLS TO HAWAII MADE VIA AT&T MTS ARE BILLED BY BAND AND
C     NOT BY MILEAGE, THE PROGRAM CONVERTS BANDS TO MILEAGE RANGES FOR
C     USE IN CALCULATING THE COSTS VIA THE OTHER CARRIERS.  THE CORRECT-
C     NESS OF THESE CONVERSIONS HAS NOT BEEN DETERMINED EXCEPT FOR THE
C     WEST COAST.
C
C     *  COSTS FOR CALLS MADE VIA DIAL ACCESS SERVICES (MCI EXECUNET AND
C     SPRINT) IN THE 56-70 AND 71-124 MILE DISTANCE RANGES ARE CALCULATED
C     USING THE RATES FOR THE 71-124 MILE RANGE SINCE AT&T MTS HAS ONLY A
C     56-124 MILE RANGE (AND THE DISTANCE (RANGE OF DISTANCES) TO THE
C     CALLED NUMBER IS CALCULATED FROM THE DURATION, RATE PERIOD, AND COST
C     OF THE ORIGINAL AT&T MTS CALL.)
C
C     *  COSTS FOR CALLS MADE VIA MCI EXECUNET OVER 3000 MILES ARE
C     CALCULATED USING THE RATES FOR THE 1911-3000 MILE RANGE SINCE
C     THERE IS NO RATE SHOWN IN THE TARIFF FOR DISTANCES GREATER THAN
C     3000 MILES.
C
C     *  COSTS FOR CALLS MADE VIA SPRINT ARE CALCULATED USING THE RATES
C     WHICH ARE DISCOUNTED FOR OVER $200 USAGE PER MONTH.
C
C     *  THE PROGRAM CALCULATES THE COSTS OF ACCESSING THE DIAL ACCESS
C     SERVICES, IF ANY, USING FIRST MINUTE AND ADDITIONAL MINUTE RATES,
C     THE RATE PERIODS IN THE TABLE IN SUBROUTINE QUERY, AND ONLY THE
C     DURATION OF THE COMPLETED LONG DISTANCE CALL.
C
C     *  SINCE ORIGINAL CALL DATA IS IN ONE MINUTE INCREMENTS, WATS AND
C     DEDICATED ACCESS SERVICE COST CALCULATIONS DO NOT CONSIDER THE
C     LESS THAN ONE MINUTE INCREMENTS USED BY THESE CARRIERS OR THE ONE
C     MINUTE MINIMUM AVERAGE TIME REQUIREMENT OF THESE CARRIERS.
C
C     *  WATS AND DEDICATED ACCESS SERVICE COST CALCULATIONS INCLUDE THE
C     MONTHLY RECURRING CHARGES PER ACCESS LINE BUT NOT ORDER OR INSTALLA-
C     TION CHARGES.  THE MONTHLY RECURRING CHARGES USED IN THE PROGRAM
C     ARE THE BASIC CHARGES WHICH ASSUME THAT THE INSTALLATION IS CLOSE
C     ENOUGH TO THE CARRIER'S POINT OF TERMINATION SO AS TO AVOID
C     ADDITIONAL MILEAGE CHARGES.
C
C     *  COSTS FOR AT&T WATS (CURRENT TARIFF) ARE CALCULATED USING SERVICE
C     AREA 6 RATES.  THE RATES USED FOR CALCULATING COSTS OF AT&T WATS
C     (PROPOSED TARIFF) ARE FOR SERVICE AREAS 5 AND 6 (WHICH HAVE THE SAME
C     RATES).
C
C     *  THE PROGRAM DOES NOT ROUND THE TOTAL HOURS OF CALLS IN EACH RATE
C     PERIOD TO THE NEAREST TENTH OF AN HOUR FOR AT&T WATS COST
C     CALCULATIONS.
C
C     *  COSTS ARE CALCULATED FOR DEDICATED ACCESS SERVICES WITH
C     "UNIVERSAL TERMINATION" (MCI WATS AND DIRECT SPRINT WITH UNIVERSAL
C     CALLING), AND NOT FOR NETWORK-ONLY TERMINATION SERVICE.
C

C  SUBROUTINES (AS THEY APPEAR IN THE MAIN PROGRAM)
C     SCCLIS - THIS SUBROUTINE PLACES SCC NETWORK LISTINGS OF AREA
C       CODES AND PREFIXES ON EACH NETWORK INTO AN ARRAY, NUM.
C     SORT - THIS SUBROUTINE SORTS TELEPHONE CALL DATA BY AREA CODE
C       AND PREFIX FOR USE IN THE MAIN PROGRAM.
C     QUERY - THIS SUBROUTINE INTERACTIVELY QUERIES THE USER FOR INPUT
C        DATA USED TO CALCULATE COSTS OF ACCESSING THE SCC NETWORKS
C        AND TO CALCULATE THE AT&T WATS COSTS (USING CURRENT AND PROPOSED
C        RATES).
C     ASK - THIS SUBROUTINE TAKES A CHARACTER STRING WHICH IS GIVEN
C       AS THE SUBROUTINE ARGUMENT AND OUTPUTS IT TO THE TERMINAL.
C     DIST - THIS SUBROUTINE CALCULATES THE DISTANCE TO A CALLED CITY
C       FROM THE DURATION, RATE PERIOD, AND COST OF THE CALL.
C     CALC - THIS SUBROUTINE CALCULATES THE COST OF EACH CALL IF IT
C       WERE MADE VIA AT&T MTS, MCI EXECUNET, AND SPRINT (BASED ON
C       DURATION OF CALL, RATE PERIOD, MILEAGE, AND, FOR MCI EXECUNET,
C       NETWORK OR NON-NETWORK CITY), SUMS THE COSTS OF CALLS (WITHIN
C       EACH RATE PERIOD, NETWORK OR NON-NETWORK CITY) FOR EACH CARRIER
C       FOR USE IN THE AT&T WATS, MCI WATS, AND DIRECT SPRINT COST
C       CALCULATIONS PERFORMED IN SUBROUTINE CALC2.
C     LINES - THIS SUBROUTINE CALCULATES ERLANGS OF CALLS DURING THE
C        BUSY HOUR AND OUTPUTS NUMBERS OF LINES AND GRADES OF SERVICE
C        FOR USE IN DETERMINING HOW MANY WATS OR ACCESS LINES TO USE
C        IN CALCULATING THE COSTS OF AT&T WATS, MCI WATS, AND DIRECT
C        SPRINT.
C     FACTOR - THIS FUNCTION CALCULATES FACTORIALS FOR USE IN
C       SUBROUTINE LINES.
C     CALC2 - THIS SUBROUTINE CALCULATES THE COST OF ALL CALLS IF THEY
C       WERE MADE VIA AT&T WATS, MCI WATS, AND DIRECT SPRINT (BASED ON
C       THE AVERAGE TIME PER ACCESS LINE PER RATE PERIOD).
C
C*****************************************************************
C  VARIABLE DEFINITIONS
C     ACCESS - A VARIABLE USED TO INDICATE IF CHARGES FOR CALLS TO
C        ACCESS THE SCC NETWORKS APPLY.
C     ACCDE - AREA CODE CALLED
```

```
C
C     ANS - A CHARACTER VARIABLE USED TO ANSWER QUESTIONS INTERACTIVELY
C
C     AVC0 - AVERAGE COST (PER MINUTE) OF AT&T MTS (ORIGINAL COST)
C     AVC1 - AVERAGE COST (PER MINUTE) OF AT&T MTS (PROPOSED RATES)
C     AVC1A - AVERAGE COST (PER MINUTE) OF AT&T WATS (CURRENT RATES)
C     AVC1B - AVERAGE COST (PER MINUTE) OF AT&T WATS (PROPOSED RATES)
C     AVC2 - AVERAGE COST (PER MINUTE) OF MCI EXECUNET
C     AVC2A - AVERAGE COST (PER MINUTE) OF MCI EXECUNET WITH ACCESS COSTS
C     AVC2B - AVERAGE COST (PER MINUTE) OF MCI WATS
C     AVC3 - AVERAGE COST (PER MINUTE) OF SPRINT
C     AVC3A - AVERAGE COST (PER MINUTE) OF SPRINT WITH ACCESS COSTS
C     AVC3B - AVERAGE COST (PER MINUTE) OF DIRECT SPRINT
C
C     AVTIME - AVERAGE TIME OF CALLS
C
C     COST - COST OF CALL
C
C     CSUM0 - SUM OF ORIGINAL AT&T MTS CALLS
C     CSUM1 - SUM OF COSTS OF CALLS MADE VIA AT&T MTS (PROPOSED RATES)
C     CSUM1A - SUM OF COSTS OF CALLS MADE VIA AT&T WATS (CURRENT RATES)
C     CSUM1B - SUM OF COSTS OF CALLS MADE VIA AT&T WATS (PROPOSED RATES)
C     CSUM2 - SUM OF COSTS OF CALLS MADE VIA MCI EXECUNET
C     CSUM2A - SUM OF COSTS OF CALLS MADE VIA MCI EXECUNET (INCLUDING
C        COSTS OF CALLS TO ACCESS)
C     CSUM2B - SUM OF COSTS OF CALLS MADE VIA MCI WATS
C     CSUM3 - SUM OF COSTS OF CALLS MADE VIA SPRINT
C     CSUM3A - SUM OF COSTS OF CALLS MADE VIA SPRINT (INCLUDING
C        COSTS OF CALLS TO ACCESS)
C     CSUM3B - SUM OF COSTS OF CALLS MADE VIA DIRECT SPRINT
C
C     FLAG(X) - AN ARRAY USED TO INDICATE IF THE AREA CODE AND PREFIX
C        OF THE CALL ARE ON THE SCC NETWORKS
C                FLAG(1) = MCI
C                FLAG(2) = GTE SPRINT
C
C     IREJ - TOTAL NUMBER OF REJECTED CALLS
C
C     ITCALL - TOTAL NUMBER OF CALLS
C
C     ITMIN - TOTAL MINUTES OF CALLS
C
C     ITMIN2 - TOTAL MINUTES OF CALLS LESS MINUTES OF CALLS UNABLE TO
C        BE PLACED VIA MCI (TO ALASKA)
C
C     LIMDIF - THE DIFFERENCE BETWEEN LIMHI AND LIMLO
C
C     LIMHI - (LIMIT HIGH) THE MAXIMUM NUMBER OF ACCESS LINES IN THE
C        RANGE OF NUMBERS OF LINES TO BE USED FOR SUBROUTINE CALC.
C
C     LIMLO - (LIMIT LOW) THE MINIMUM NUMBER OF ACCESS LINES IN THE
C        RANGE OF NUMBERS OF LINES TO BE USED FOR SUBROUTINE CALC.
C
C     MILES - DISTANCE (RANGE OF DISTANCES) TO CALLED CITY (CALCULATED
C        IN SUBROUTINE DIST)
C
C     MIN - LENGTH OF CALL IN MINUTES
C
C     NCALLS - TOTAL NUMBER OF CALL DATA SETS FROM THE FILE TOLL DATA
C
C     NLINES - NUMBER OF ACCESS LINES
C
C     NNX - PREFIX (NNX) CALLED
C
C     NOMCI - NUMBER OF CALLS UNABLE TO PLACED VIA MCI (TO ALASKA)
C
C     NOMIN - TOTAL MINUTES OF CALLS UNABLE TO BE PLACED VIA MCI
C        (TO ALASKA)
C
```

```
C     NUM(X,X,X) - AN ARRAY USED TO STORE AREA CODES AND
C        PREFIXES ON THE SCC NETWORKS
C           1ST POSITION - SCC
C              1 - MCI
C              2 - GTE SPRINT
C           2ND POSITION - TRANSLATED AREA CODE
C              EXAMPLE: 25 = AREA CODE 312
C           3RD POSITION - PREFIX (NNX)
C
C     NXA - A TRANSLATED VALUE FOR THE AREA CODE, ACODE.
C
C     OUTPUT - A VARIABLE USED TO INDICATE IF RESULTS OF SUBROUTINE CALC
C        ARE TO BE OUTPUT FOR EACH CALL DATA SET.
C
C     PERIOD - RATE PERIOD
C        1 = BUSINESS DAY
C        2 = EVENING
C        3 = NIGHT AND WEEKEND
C
C     PLACE - LOCATION CALLED
C
C     NOTE: VARIABLES USED AS SUBROUTINE ARGUMENTS, EVEN THOUGH THEY MAY
C     BE OUTPUT IN THE MAIN PROGRAM, ARE DEFINED IN THE SUBROUTINES.

      SUBROUTINE DIST(I,BAND,MILES)
C*****************************************************************
C
C     THIS SUBROUTINE CALCULATES THE DISTANCE TO A CALLED CITY FROM
C     THE DURATION, RATE PERIOD, AND COST OF THE CALL.
C     THE RATES USED IN THIS SUBROUTINE ARE FROM AMERICAN TELEPHONE
C     AND TELEGRAPH CO. FCC TARIFF NO. 263, 1 FEB 1984.
C
C     NOTE: THE RATES USED IN THIS SUBROUTINE MUST BE THOSE FROM THE AT&T
C     TARIFF IN EFFECT WHEN THE CALLS WERE ORIGINALLY MADE AND BILLED.
C
C*****************************************************************
C
C     AT&T MTS CHARGES ARE BASED ON A RATE FOR THE FIRST MINUTE PLUS A
C     RATE FOR ADDITIONAL MINUTES IN EACH RATE PERIOD.  THE DURATION OF
C     A CALL IS ROUNDED UP TO THE NEXT HIGHER MINUTE.    COSTS ARE
C     CALCULATED AT THE DAY RATE, REGARDLESS OF THE RATE PERIOD, THEN
C     DISCOUNTED ACCORDING TO THE RATE PERIOD IN WHICH THE CALL WAS MADE.
C     TENTHS OF A CENT ARE TRUNCATED FROM THE COSTS CALCULATED FOR EACH
C     AT&T MTS CALL.
C
C*****************************************************************
C
C  VARIABLE DEFINITIONS
C
C     ACODE - AREA CODE CALLED
C
C     BAND - BAND (GEOGRAPHICAL REGION) FROM WHICH CALLS TO HAWAII ARE
C        ORIGINATED
C
C     COST - COST OF CALL
C     NOTE: .0001 IS ADDED TO COST TO CORRECT FOR MACHINE ROUNDING
C        ERROR.
C
C     COST1 - A VARIABLE USED TO ADD .0001 TO COST TO CORRECT FOR
C        MACHINE ROUNDING ERROR
C
C     DISC - DISCOUNT FACTOR.  AT&T OFFERS THE FOLLOWING DISCOUNTS FOR
C        CALLS:
C           EVENING  40 PERCENT (OR COST TIMES .6)
C           NIGHT AND WEEKEND  60 PERCENT (OR COST TIMES .4)
C           NIGHT AND WEEKEND TO ALASKA AND HAWAII  55 PERCENT (OR COST
C              TIMES .45) (AT&T CURRENT RATES ONLY)
C
C     (NOTE: AT&T CALCULATES THE COST OF ALL CALLS BY APPLYING THE
C        DAY RATES, MULTIPLYING BY DISCOUNT FACTOR, AND TRUNCATING
C        TENTHS OF A CENT.)
C
C     ICOST _ INTEGERED COST OF CALL TIMES 100
C
C     ITCOST - INTEGERED TEMPORARY COST (TCOST) TIMES 100
C
C     (NOTE: ICOST AND ITCOST ARE USED TO TRUNCATE TENTHS OF CENTS FOR
C     COMPARISON BETWEEN ORIGINAL COST (+ .0001) (ICOST) AND CALCULATED
C     COST (ITCOST) OF CALL)
```

```
C
C     MILES - DISTANCE (RANGE OF DISTANCES) TO CALLED CITY
C       1        1-10     MILES
C       2       11-22     MILES
C       3       23-55     MILES
C      *4       56-124    MILES
C       5      125-292    MILES
C       6      293-430    MILES
C       7      431-925    MILES
C       8      926-1910   MILES
C       9     1911-3000   MILES
C      10     3001-4250   MILES
C      11     4251-5750   MILES
C
C     *NOTE: MCI AND GTE SPRINT USE DISTANCE RANGES OF 56-70 AND 71-124
C     WHILE AT&T USES 56-124.  COSTS FOR ALL MCI AND GTE SPRINT CALLS
C     IN THE 56-124 MILE RANGE ARE CALCULATED AT THE 71-124 RATES.
C
C     MIN - LENGTH OF CALL IN MINUTES
C
C     NMIN - ADDITIONAL MINUTES (TOTAL MINUTES LESS 1 MINUTE). THIS IS
C        NECESSARY SINCE AT&T AND SPRINT CALLS ARE BILLED BY FIRST
C        MINUTE TIMES FIRST MINUTE RATE PLUS ADDITIONAL MINUTES TIMES
C        ADDITIONAL MINUTE RATE
C
C     PERIOD - RATE PERIOD
C        1 = BUSINESS DAY
C        2 = EVENING
C        3 = NIGHT AND WEEKEND
C
C     ICOST - TEMPORARY COST (CALCULATED COST OF CALL)
C
C
      INTEGER ACODE,ICOST,ITCOST
      INTEGER*2 BAND,PERIOD
      CHARACTER*13 PLACE
      LOGICAL*1 FLAG(2)
      COMMON /B/MIN(2000),PERIOD(2000),PLACE(2000),ACODE(2000),
     -NMIN(2000),COST(2000),FLAG
C
C     THE FOLLOWING TWO STATEMENTS ADD .0001 TO COST TO ACCOUNT FOR
C     MACHINE ROUNDING ERROR AND CALCULATE AN INTEGERED VALUE OF COST
C     TIMES 100 (ICOST) TO COMPARE WITH CALCULATED VALUES OF ITCOST
C     TO DETERMINE THE DISTANCE RANGE.
C
      COST1=COST(I)+.0001
      ICOST=IFIX(COST1*100.)
C

     -MIN313,MIN323,MIN333)
C*****************************************************************
C
C     THIS SUBROUTINE CALCULATES THE COST OF EACH CALL IF IT WERE MADE
C     VIA AT&T MTS (PROPOSED RATES), MCI EXECUNET, AND SPRINT (BASED
C     ON DURATION OF CALL, RATE PERIOD, MILEAGE, AND, FOR MCI EXECUNET,
C     NETWORK OR NON-NETWORK CITY), AND SUMS THE COSTS OF CALLS (WITHIN
C     EACH RATE PERIOD, NETWORK OR NON-NETWORK CITY) FOR EACH CARRIER
C     FOR USE IN THE AT&T WATS, MCI WATS, AND DIRECT SPRINT COST
C     CALCULATIONS PERFORMED IN SUBROUTINE CALC2.
C
C     RATES USED IN THIS SUBROUTINE ARE FROM THE FOLLOWING TARIFFS:
C
C     AT&T MTS (PROPOSED RATES)
C
C        AT&T COMMUNICATIONS TARIFF FCC NO. 1, PP 56, 59, ISSUED
C           3 OCT 1983, EFFECTIVE DATE POSTPONED INDEFINITELY.
C
C     MCI EXECUNET
C
C        MCI TELECOMMUNICATIONS CORPORATION TARIFF FCC NO.1, P 19,
C           1 APR 1983.
C
C     SPRINT
C
C        GTE SPRINT COMMUNICATIONS CORPORATION TARIFF FCC NO. 11, P 34,
C           5 JAN 1984.
```

```
C
C*****************************************************************
C
C     METHODS OF APPLYING THE TARIFFS ARE DESCRIBED BELOW.
C
C     AT&T MTS AND SPRINT CHARGES ARE BASED ON A RATE FOR THE FIRST
C     MINUTE PLUS A RATE FOR ADDITIONAL MINUTES IN EACH RATE PERIOD,
C     WHILE MCI EXECUNET HAS A SINGLE RATE FOR ALL MINUTES IN A RATE
C     PERIOD.  ALL OF THESE SERVICES ROUND UP THE DURATION OF THE CALL
C     TO THE NEXT HIGHER MINUTE--THEY BILL IN ONE MINUTE INCREMENTS.
C     AT&T MTS COSTS ARE CALCULATED AT THE DAY RATE, REGARDLESS OF RATE
C     PERIOD, THEN DISCOUNTED ACCORDING TO THE RATE PERIOD IN WHICH THE
C     THE CALL WAS MADE.  (THE DISCOUNTS ARE 40 PERCENT FOR THE EVENING
C     RATE PERIOD AND 60 PERCENT FOR THE NIGHT AND WEEKEND RATE PERIOD.
C     A 55 PERCENT DISCOUNT IS APPLIED TO CALLS TO ALASKA AND HAWAII
C     DURING THE NIGHT AND WEEKEND RATE PERIOD UNDER THE CURRENT TARIFF.)
C     SPRINT SERVICE IS DISCOUNTED BASED UPON TOTAL DOLLAR AMOUNT OF THE
C     BILL.  MCI EXECUNET HAS SEPARATE RATES FOR CALLS TO NETWORK AND
C     NON-NETWORK CITIES.  TENTHS OF A CENT ARE TRUNCATED FROM THE COSTS
C     CALCULATED FOR EACH AT&T MTS CALL AND ARE ROUNDED FOR EACH MCI
C     EXECUNET AND SPRINT CALL.
C
C*****************************************************************
C
C  VARIABLE DEFINITIONS
C
C     ACODE - AREA CODE CALLED
C
C     BAND - BAND (GEOGRAPHICAL REGION) FROM WHICH CALLS TO HAWAII ARE
C        ORIGINATED
C
C     COST - COST OF CALL
C
C     COST1 - COST OF CALL IF MADE VIA AT&T MTS (PROPOSED RATES)
C     COST2 - COST OF CALL IF MADE VIA MCI EXECUNET
C     COST2A - COST OF CALL IF MADE VIA MCI EXECUNET (INCLUDING COST
C        OF CALL TO ACCESS)
C     COST3 - COST OF CALL IF MADE VIA SPRINT
C     COST3A - COST OF CALL IF MADE VIA SPRINT (INCLUDING
C        COST OF CALL TO ACCESS)
C
C     CSUM0 - SUM OF ORIGINAL AT&T MTS CALLS
C     CSUM1 - SUM OF COSTS OF CALLS MADE VIA AT&T MTS (PROPOSED RATES)
C     CSUM2 - SUM OF COSTS OF CALLS MADE VIA MCI EXECUNET
C     CSUM2A - SUM OF COSTS OF CALLS MADE VIA MCI EXECUNET (INCLUDING
C        COSTS OF CALLS TO ACCESS)
C     CSUM3 - SUM OF COSTS OF CALLS MADE VIA SPRINT
C     CSUM3A - SUM OF COSTS OF CALLS MADE VIA SPRINT (INCLUDING
C        COSTS OF CALLS TO ACCESS)
C
C     DISC - DISCOUNT FACTOR.  AT&T OFFERS THE FOLLOWING DISCOUNTS FOR
C        CALLS:
C           EVENING  40 PERCENT (OR COST TIMES .6)
C           NIGHT AND WEEKEND  60 PERCENT (OR COST TIMES .4)
C
C     (NOTE: AT&T CALCULATES THE COST OF ALL CALLS BY APPLYING THE
C        DAY RATES, MULTIPLYING BY DISCOUNT FACTOR, AND TRUNCATING
C        TENTHS OF A CENT.)
C
C     DISC2 - THE DISCOUNT FACTOR FOR EVENING RATE PERIOD
C
C     DISC3 - THE DISCOUNT FACTOR FOR NIGHT AND WEEKEND RATE PERIOD
C
C     FLAG(X) - AN ARRAY USED TO INDICATE IF THE AREA CODE AND PREFIX
C        OF THE CALL ARE ON THE SCC NETWORKS
C              FLAG(1) = MCI
C              FLAG(2) = GTE SPRINT
C
```

```
C      I - THE NUMBER OF THE CALL IN THE ARRAY OF CALL DATA
C
C      ICOST1 - A TEMPORARY VALUE OF COST TIMES 100 USED TO TRUNCATE
C         TENTHS OF CENTS
C
C      MILES - DISTANCE (RANGE OF DISTANCES) TO CALLED CITY (CALCULATED
C         IN SUBROUTINE DIST)
C
C      MIN - LENGTH OF CALL IN MINUTES
C
C      MINXXX - SUM OF MINUTES
C         1ST DIGIT - CARRIER
C            1 - AT&T
C            2 - MCI
C            3 - GTE SPRINT
C         2ND DIGIT - RATE PERIOD
C            1 - BUSINESS DAY
C            2 - EVENING
C            3 - NIGHT AND WEEKEND
C         3RD DIGIT - NETWORK/NON-NETWORK
C            1 - TO NETWORK CITY
C            2 - TO NON-NETWORK CITY
C            3 - TO ALASKA OR HAWAII NON-NETWORK CITY (GTE SPRINT ONLY)
C            NO 3RD DIGIT - AT&T
C
C      NMIN - ADDITIONAL MINUTES (TOTAL MINUTES LESS 1 MINUTE) THIS IS
C         NECESSARY SINCE AT&T AND SPRINT CALLS ARE BILLED BY FIRST
C         MINUTE TIMES FIRST MINUTE RATE PLUS ADDITIONAL MINUTES TIMES
C         ADDITIONAL MINUTE RATE
C
C      NCMCI - NUMBER OF CALLS UNABLE TO PLACED VIA MCI (TO ALASKA)
C
C      NOMIN - TOTAL MINUTES OF CALLS UNABLE TO BE PLACED VIA MCI
C         (TO ALASKA)
C
C      PERIOD - RATE PERIOD
C         1 = BUSINESS DAY
C         2 = EVENING
C         3 = NIGHT AND WEEKEND
C
C      RATEXX - RATE FOR CALL TO ACCESS MCI EXECUNET OR SPRINT
C         1ST POSITION - RATE PERIOD
C            1 - BUSINESS DAY
C            2 - EVENING
C            3 - NIGHT AND WEEKEND
C         2ND POSITION - FIRST OR ADDITIONAL MINUTE RATE
C            NO VALUE - FIRST MINUTE RATE
C            A - ADDITIONAL MINUTE RATE
C
C

      SUBROUTINE LINES(MIN11)
C*************************************************************
C
C     THIS SUBROUTINE CALCULATES ERLANGS OF CALLS DURING THE
C     BUSY HOUR AND OUTPUTS NUMBERS OF LINES AND GRADES OF SERVICE
C     (CALCULATED USING THE ERLANG B EQUATION (SEE SMITH, SYDNEY F.,
C     TELEPHONY AND TELEGRAPHY, OXFORD UNIVERSITY PRESS, P 180, 1978.))
C     FOR USE IN DETERMINING HOW MANY WATS OR ACCESS LINES TO USE
C     IN CALCULATING THE COSTS OF AT&T WATS, MCI WATS, AND DIRECT
C     SPRINT.
C
C     NOTE:  THIS SUBROUTINE ASSUMES AN AVERAGE OF 22 BUSINESS DAYS IN
C     A MONTH AND APPROXIMATELY 17 PERCENT OF ALL CALLS MADE DURING THE
C     BUSINESS DAY (8 HOURS) OCCUR DURING THE BUSY HOUR.
C
C     THE ERLANG B EQUATION IS:
C
C                                N
C                           ERL    / N!
C           B = ----------------------------------
C                                2              N
C               1 + ERL + ERL   / 2! + ... + ERL  / N!
C
C*************************************************************
C
```

```

      -CSUM3B)
C*************************************************************************
C
C      THIS SUBROUTINE CALCULATES THE COST OF ALL CALLS IF THEY WERE MADE
C      VIA AT&T WATS (CURRENT AND PROPOSED TARIFF RATES), MCI WATS, AND
C      DIRECT SPRINT (BASED ON THE AVERAGE TIME PER ACCESS LINE PER RATE
C      PERIOD).
C
```

```
C     RATES USED IN THIS SUBROUTINE ARE FROM THE FOLLOWING TARIFFS:
C
C     AT&T WATS (CURRENT RATES)
C
C        AMERICAN TELEPHONE AND TELEGRAPH CO. TARIFF FCC NO. 259,
C          PP 13-14.1, 1 JAN 1984.
C
C     AT&T WATS (PROPOSED RATES)
C
C        AT&T COMMUNICATIONS TARIFF FCC NO. 2, PP 74-75, ISSUED
C           3 OCT 1983, EFFECTIVE DATE POSTPONED INDEFINITELY.
C
C     MCI WATS
C
C        MCI TELECOMMUNICATIONS CORPORATION TARIFF FCC NO.1, PP 19.6-
C           19.7, 1 APR 1983.
C
C     DIRECT SPRINT
C
C        GTE SPRINT COMMUNICATIONS CORPORATION TARIFF FCC NO. 10, PP 42-
C           49, 5 JAN 1984.
C
C*************************************************************************
C
C     METHODS OF APPLYING THE TARIFFS ARE DESCRIBED BELOW.
C
C     AT&T WATS MEASURES THE DURATION OF A CALL IN ONE SECOND INCREMENTS,
C     MCI WATS USES THIRTY SECOND INCREMENTS, AND DIRECT SPRINT USES SIX
C     SECOND INCREMENTS.  ALL THREE OF THESE SERVICES HAVE A ONE MINUTE
C     MINIMUM AVERAGE TIME REQUIREMENT.  ALSO, ALL THREE HAVE THE SAME
C     POINTS AT WHICH THE RATES TAPER; 15, 40, AND 80 HOURS (OR EQUIV-
C     ALENT MINUTES).  COSTS ARE CALCULATED BASED ON AVERAGE USE PER LINE
C     PER RATE PERIOD.  IN OTHER WORDS, THE TOTAL USAGE IN EACH RATE
C     PERIOD FOR ALL LINES (WATS LINES OR DALS) IS DIVIDED BY THE NUMBER
C     OF LINES TO OBTAIN AN AVERAGE USE PER LINE PER RATE PERIOD.
C     (AT&T WATS ROUNDS THIS AVERAGE TO THE NEAREST TENTH OF AN HOUR.)
C     MCI WATS AND DIRECT SPRINT ALSO CALCULATE THE AVERAGE FOR CALLS TO
C     NETWORK AND NON-NETWORK CITIES.  THE AVERAGE USE PER LINE PER RATE
C     PERIOD AND THE PER LINE MONTHLY RECURRING CHARGES ARE USED TO
C     CALCULATE THE COST PER LINE.  THE COST PER LINE IS MULTIPLIED BY
C     THE TOTAL NUMBER OF LINES TO OBTAIN THE TOTAL COST.
C
C*************************************************************************
C
C     THE RESULTS OF THESE CALCULATIONS WILL BE LARGER THAN ACTUAL FOR
C     THE SERVICES THAT ARE BILLED IN LESS THAN ONE MINUTE INCREMENTS.
C     (IN OTHER WORDS, COSTS FOR THE CALLS WOULD BE LESS THAN THESE
C     CALCULATIONS WOULD INDICATE.)
C
C     IF EXACT LENGTH OF CALL DATA IS AVAILABLE THIS SUBROUTINE WILL
C     NEED TO BE CHANGED SINCE AT&T WATS BILLS CALLS IN ONE SECOND
C     INCREMENTS, DIRECT SPRINT BILLS CALLS IN SIX SECOND INCREMENTS,
C     AND MCI WATS BILLS CALLS IN THIRTY SECOND INCREMENTS.
C
C*************************************************************************
C
C  VARIABLE DEFINITIONS
C
C     CXXX - COST OF CALL
